1 Executive Summary

The executive summary is a brief synopsis of the report and should not be read in lieu of reading the report in its entirety. EXP Services Inc. (EXP) was retained by **On The Lake Developments** (the "Client") to conduct a Phase Two Environmental Site Assessment (ESA) of the property located at 1544 & 1546 Four Mile Creek Road, in Niagara-on-the-Lake, Ontario and hereinafter referred to as the "Site".

The Site is approximately 1.07 hectares (2.64 acres) in size and is currently occupied by a split-level residential home and a detached, formerly commercial garage. The Site was first developed for mixed commercial and residential use in the 1960s and historically has been used as a garage for construction and maintenance of marine vehicles. Two underground storage tanks (USTs) are associated with the Site; one (1) historical UST located at the exterior of the garage, and one (1) present UST currently located at the north end of the residential building.

It is EXP's understanding that the Client intends to re-develop the Site as mixed residential and commercial land use. Although conceptual plans were provided in draft at the time of this Phase Two ESA, it was assumed that two buildings would be constructed: a twenty-nine (29) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. Two hundred (200) parking spaces are proposed, ninety-five (95) surface and one hundred and five (105) in P1 underground. The at-grade parking it proposed for the central portion of the Site, between the two proposed building structures. Based on the current and proposed land use of the Site, a Record of Site Condition (RSC) will be required. As such, the objective of the investigation was to support the filing of an RSC in accordance with O.Reg.153/04. The Phase Two ESA was conducted in accordance with the Phase Two ESA standard defined by O. Reg. 153/04, as amended; and in accordance with generally accepted professional practices. Subject to this standard of care, EXP makes no express or implied warranties regarding its services and no third-party beneficiaries are intended. Limitation of liability, scope of report and third-party reliance are outlined in Appendix A of this report.

The objective of the Phase Two ESA was to assess the areas of potential environmental concern (APECs) identified in the Phase One ESA completed by EXP, dated October 7, 2024 (EXP, 2024). The relevant APECs identified in the Phase One ESA are provided in the table below.

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)[1]	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern[2]	Media Potentially Impacted (Groundwater, soil and/or sediment)
APEC 1: Former equipment and marine vehicle repairs	Central portion of the Site	PCA 1: #27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil and Groundwater
APEC 2A: Importation of Fill Material	Northern portion of the Site	PCA 2: #30 - Importation of Fill	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B,	Soil

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)[1]	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern[2]	Media Potentially Impacted (Groundwater, soil and/or sediment)
		Material of Unknown Quality		Cr(VI), CN-, Hg, EC, SAR, PCBs	
APEC 2B: De-icing Activities	Northern portion of the Site	PCA 2B: #Other – De-icing Activities	On-Site	EC, SAR	Soil
APEC 3: Former USTs	South-Central portion of the Site	PCA 3: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, VOCs, Metals, Sb, As, Se	Soil and Groundwater
APEC 4: Historical orchard/vineyard	Southern portion of the Site	PCA 4: #40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	On-Site	OC Pesticides, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil
APEC 5: Vent/fill pipes at residential structure	Southeastern portion of the Site	PCA 5: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, PAHs, VOCs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil and Groundwater

(1) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg.153/04, as amended) that is occurring or has occurred in a phase one Study area.
(2) PHCs – Petroleum Hydrocarbons; BTEX – Benzene, Toluene, Ethylbenzene, and Xylene; VOCs – Volatile Organic Compounds; PAHs – Polycyclic Aromatic Hydrocarbons; Metals – Metals (including Hydride Metals); ORPs – Other Regulated Parameters [EC - electrical conductivity; SAR - sodium adsorption ratio; Hg – mercury; CN – cyanide; B-HWS - boron (hot-water-soluble); CrVI - hexavalent chromium; and pH]; OC pesticides – Organochlorine pesticides; PCBs – polychlorinated biphenyls.

Based on the findings of the Phase One ESA and conclusions, a Phase Two ESA was recommended to assess the soil and groundwater conditions at the Site.

The results and findings of the Phase Two ESA conducted at the Site are summarized as follows:

- Between September 24 to 26, 2024 a total of eight (8) boreholes (BH1 to BH8) were advanced at the Site to a maximum depth of 11.28 metres below ground surface (mbgs) by a licensed well contractor, Terra Firma Environmental Services Ltd. (Terra Firma), under the full-time supervision of EXP staff. Three (3) of the boreholes were instrumented with groundwater monitoring wells (BH3, BH4, and BH7), installed for environmental purposes. Please note that the drilling investigation was carried out as part of a combined geotechnical/environmental/hydrogeological investigation and that not all borehole locations were sampled for environmental purposes.

- The general stratigraphy at the Site was comprised of topsoil and/or granular fill, underlain by fill (silty clay to sandy silt fill), overlying native layers of silty clay, and sandy silt till (BH1). Fill material was encountered at all borehole locations, except for BH2 and BH3. Bedrock was not encountered at the borehole completion depths, to a maximum investigative depth of 11.28 mbgs.

- The monitoring well network advanced as part of this Phase Two ESA consisted of three (3) (BH3, BH4, and BH7) monitoring wells screened within the native soils. In addition, three (3) pre-existing wells (BH1-23, BH2-23, and BH5-23) installed during a previous investigation were used for groundwater monitoring.

- During the first groundwater monitoring event in October 2024 (round 1), only one (1) newly installed well (BH4) was accessible for groundwater monitoring due to the other two (2) (BH3 and BH7) being dry at the time of the investigation. The four (4) accessible monitoring wells were sampled by EXP on October 2, 2024. The measured depth of the groundwater table ranged from 0.41 (BH1-23) to 1.67 (BH2-23) mbgs during the October monitoring event; the calculated groundwater elevations ranged from 90.87 (BH2-23) to 92.24 (BH1-23) masl (metres above sea level).

- Supplemental groundwater sampling events were carried out on November 21 (round 2) and December 2, 2024 (round 3). Groundwater samples were obtained from previously inaccessible monitoring wells BH3 and BH7 on November 21, 2024, to assess APEC 5 (fill pipes at the north portion of the residential home on-Site), and horizontally delineate groundwater impacts, respectively. Supplemental groundwater samples were also obtained on November 21, 2024 from monitoring wells BH4, BH2-23 and BH5-23, to re-assess identified polycyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylenes (BTEX), and metal exceedances in the round 1 sampling event. On December 2, 2024, supplemental groundwater samples were obtained from BH3, BH4, BH7, BH2-23 and BH5-23 to further assess identified PAH, BTEX, and metal exceedances. All six (6) groundwater monitors were checked by EXP on December 2, 2024. The measured depth of the groundwater table from round 2 and 3 ranged from 0.7 (BH1-23/BH4) to 6.7 (BH3) mbgs; the calculated groundwater elevations ranged from 85.84 (BH3) to 91.94\5 (BH1-23) masl in the groundwater monitors.

- Based on the available groundwater depth measurements and the available groundwater monitors, a groundwater contour map was generated for the Site. Regional groundwater flow direction is inferred to be northwest. Localized flow conditions across the site indicate a groundwater flow to the north to northwest in the unconfined clayey silt to silty clay aquifer.

- The shallow horizontal hydraulic gradient on-Site was an average of 0.1 m/m to 0.01 m/m to the north to northwest, depending on the time of year.

- For assessment purposes, EXP selected the MECP (2011) Table 1: Full Depth Background Site Condition Standards (SCS) for Residential/Parkland/Institutional/Commerical/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the “Table 1 SCS”).

- Soil samples were submitted for the analysis of PHCs, BTEX, volatile organic compounds (VOCs), PAHs, polychlorinated biphenyls (PCBs), organochlorine pesticides (OCPs), metals (including hydrides), and/or other regulated parameters (ORPs) (boron-hot water soluble (B-HWS), hexavalent chromium (Cr (VI)), mercury (Hg), cyanide (CN), electrical

conductivity (EC), sodium adsorption ratio (SAR), pH). All soil parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of EC and PHCs, as follows:

  - Exceedances of PHC fraction F2 at BH4-SS3 (depth of 1.52 to 2.13 mbgs). A deeper sample from this location, BH4-SS7 (depth of 6.09 to 6.70 mbgs), was found to be within the Table 1 SCS for PHCs;

  - Exceedance of EC at BH5-SS1 (depth of 0.0 - 0.61 mbgs). A deeper sample from this location, BH5-SS7 (depth of 6.09 to 6.70 mbgs), was found to be within the Table 1 SCS for EC;

  - A pH (surficial) outside of the range of 5-9 was identified in samples BH5-SS1 (depth of 0.0 to 0.61 mbgs) and BH1-SS1 (depth of 0.0 to 0.61 mbgs). However, as the Table 1 SCS are applicable to the Site, these pH values are in line with the application of these standards.

- Based on the reported analytical results, an exceedance of EC was identified at the Site. It is the Qualified Person's (QP's) opinion that the elevated concentration of EC is associated with de-icing and salting substances routinely applied on-site during the winter months for vehicular and pedestrian safety. Therefore, as per Section 49.1 (1) of O. Reg. 153/04, which references Section 2 of Ontario Regulation 339 of the Revised Regulations of Ontario, 1990 (Classes of Contaminants – Exceptions), it is in the QP_{ESA}'s opinion that the elevated levels of EC are not exceedances of the applicable Table 1 SCS.

- A total of three (3) rounds of groundwater monitoring were completed. Monitoring occurred on October 2, 2024, November 21, 2024, and December 2, 2024 (round 1, round 2, round 3, respectively).

- Groundwater samples were submitted during the first round of groundwater monitoring for the analysis of PHCs, BTEX, VOCs, PAHs, metals (including hydrides) and ORPs (Cr (VI), Hg, CN, sodium (Na), chloride (Cl)) from newly installed and accessible monitoring well BH4, and pre-existing monitoring wells BH1-23, BH2-23, BH5-23. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of ethylbenzene, PAHs (anthracene, chrysene, phenanthrene, pyrene), and metals (cobalt, nickel, selenium, and uranium), as follows:

  - Ethylbenzene and PAH (anthracene, chrysene, phenanthrene, pyrene) exceedances above the Table 1 SCS were identified in BH4 (having a screen depth of 0.91 to 3.96 mbgs);

  - Metals (cobalt, nickel, selenium, uranium) exceedances above the Table 1 SCS were identified in BH5-23 and its duplicate sample, BH5-23-0 (having a screen depth of 5.33 to 6.85 mbgs);

  - Uranium exceedance above the Table 1 SCS were identified in BH2-23 (having a screen depth of 4.42 to 7.47).

- Groundwater samples were submitted during the second round of groundwater monitoring for the analysis of PHCs, BTEX, VOCs, PAHs, metals (including hydrides) and ORPs (Cr (VI), Hg, CN, Na, Cl). Previously dry wells BH3 and BH7 were sampled during this event. Additionally, supplemental samples from BH4, BH2-23, and BH5-23 were obtained to assess the previously identified exceedances for PAHs, BTEX, and metals. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of metals (uranium and vanadium), as follows:

  - Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH2-23 (having a screen depth of 4.42 to 7.47), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).

  - A vanadium exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).

- Groundwater samples were submitted during the third round of groundwater monitoring for the analysis of PAHs, BTEX, and metals from BH3, BH4, BH7, BH2-23, and BH5-23. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of metals (cobalt, uranium, and vanadium), as follows:
    - Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).
    - A vanadium and cobalt exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).
- Given the two (2) consecutive clean rounds of groundwater sampling for nickel and selenium at BH5-23, these contaminants are not considered to be in exceedances of the Table 1 SCS at the Site.
- No evidence of free product (i.e. visible film or hydrocarbon sheen), or odour was observed during soil sampling, groundwater purging, or any of groundwater sampling events.

Soil in exceedance of the O. Reg. 153/04 Table 1 SCS for PHCs and groundwater in exceedance of the Table 1 SCS for metals (cobalt, uranium and vanadium) must be addressed prior to filing an RSC.

EXP is currently planning to re-sample the elevated pH values at the Site and remediate the soil PHC impacts at BH4 and historical location BH1-23. Further, a non-potable request application will be submitted to the Niagara Region, in order to apply Table 9 Standards to the Site. Pending favourable outcomes to these items and once subsequent reporting are completed, an RSC can be filed for the Site.

2 Introduction

EXP Services Inc. (EXP) was retained by **On The Lake Developments** (the "Client") to conduct a Phase Two Environmental Site Assessment (ESA) of the property located at the west side of Four Mile Creek and 15m northeast of Line 2 Road, at 1544 & 1546 Four Mile Creek Road, in Niagara-on-the-Lake, Ontario, hereinafter referred to as the "Site" (Figure 1).

This Phase Two ESA was conducted in accordance with the Phase Two ESA standard defined by Ontario Regulation 153/04, as amended (O.Reg.153/04); and in accordance with generally accepted professional practices. Subject to this standard of care, EXP makes no express or implied warranties regarding its services and no third-party beneficiaries are intended. Limitation of liability, scope of report and third-party reliance are outlined in Appendix A. Tables and Figures referenced throughout the report are provided at the beginning of the Appendices.

The Site is approximately 1.07 hectares (2.64 acres) in size and is currently occupied by a split-level residential home and a detached, formerly commercial garage. The Site was first developed for mixed commercial and residential use in the 1960s and historically has been used as a garage for construction and maintenance of marine vehicles. An underground storage tank (UST) was located at the exterior of the garage and west of the residential home.

It is EXP's understanding that the Client intends to re-develop the Site as mixed residential and commercial land use. Although conceptual plans were provided in draft at the time of this Phase Two ESA, it was assumed that two buildings would be constructed: a twenty-nine (29) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. Two hundred (200) parking spaces are proposed, ninety-five (95) surface and one hundred and five (105) in P1 underground. The at-grade parking it proposed for the central portion of the Site, between the two proposed building structures. Based on the current and proposed land use of the Site, a Record of Site Condition (RSC) will be required. As such, the objective of the investigation was to support the filing of an RSC in accordance with O.Reg.153/04. The objective of the Phase Two ESA was to assess the areas of potential environmental concern (APECs) identified in the Phase One ESA completed by EXP, dated October 7 (EXP, 2024).

2.1 Site Description

The Site is located at the west side of Four Mile Creek and 15 metres northwest of Line 2 Road in Niagara-on-the-Lake, Ontario (see Figure 1). The Site is approximately 1.07 hectares (2.64 acres) in size. At the time of the investigation, the Site consisted of one (1) residential structure in the southeastern portion and one (1) vacant garage structure (formerly used for marine vehicle repairs) in the central portion.

2.2 Legal Description and Property Ownership

The legal description and property ownership are as follows.

Municipal Address(es)	1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario
Current Land Use	Residential/Commercial
Proposed Land Use	Residential/Commercial
Legal Description	PT TWP LT 112 NIAGARA; PT RDAL BTN TWP LT 111 & 112 NIAGARA PT 1 30R668 & AS IN RO119545 EXCEPT PT 4 SPPL85; PT 2 30R668, RO164363, BLOCK 46831 S/T INTEREST OF THE MUNICIPALITY; NIAGARA-ON-THE-LAKE PT TWP LT 112 NIAGARA AS IN RO7678 EXCEPT HWY637; NIAGARA-ON-THE-LAKE
Property Identification Number (PIN)	46383-0086 (LT) 46383-0087 (LT)

Approximate Universal Transverse Mercator (UTM) coordinates	NAD83 17T 652530 m E 4786792 m N
Accuracy Estimate of UTM	10-15 m
Measurement Method	GPS
Site Area	1.07 hectares (2.64 acres)
Property Owner	Esfandiar Aghaei and On The Lake Developments Inc.
Owner Contact Address	Stephen Aghaei 3985 Highway 7 East, Suite 202 Markham, ON, L3R 2A2

A signed Plan of Survey, prepared by Dasha Page, O.L.S., by J.D. Barnes Limited, dated February 19, 2025, is included in Appendix B.

2.3 Current and Proposed Future Uses

At the time of the Site visit, the Site was occupied by a split-level residential home and a detached, formerly commercial garage. The remainder of the Site consisted of an asphalt parking lot and landscaped areas.

It is EXP's understanding that the Client intends to re-develop the Site as mixed residential and commercial land use. Although conceptual plans were provided in draft at the time of this Phase Two ESA, it was assumed that two buildings would be constructed: a twenty-nine (29) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. Two hundred (200) parking spaces are proposed, ninety-five (95) surface and one hundred and five (105) in P1 underground. Theat-grade parking it proposed for the central portion of the Site, between the two proposed building structures. Based on the current and proposed land use of the Site, an RSC will be required. As such, the objective of the investigation was to support the filing of an RSC in accordance with O.Reg.153/04.

2.4 Applicable Site Condition Standards

Analytical results obtained for site soil and groundwater samples were assessed against Site Condition Standards (SCS) as established under subsection 169.4(1) of the Environmental Protection Act, and presented in the document MECP "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act", ("SGWS" Standards), (MECP, 2011). Tabulated background SCS (Table 1) applicable to environmentally sensitive sites and effects based generic SCS (Tables 2 to 9) applicable to non-environmentally sensitive sites are provided in MECP (2011). The effects based SCS (Tables 2 to 9) are protective of human health and the environment for different groundwater conditions (potable and non-potable), land use scenarios (residential, parkland, institutional, commercial, industrial, community and agricultural/other), soil texture (coarse or medium/fine) and restoration depth (full or stratified).

Tables 1 to 9 of MECP Standards are summarized as follows:

- Table 1 – applicable to sites where background concentrations must be met (full depth), such as sensitive sites where site-specific criteria have not been derived;
- Table 2 – applicable to sites with potable groundwater and full depth restoration;
- Table 3 – applicable to sites with non-potable groundwater and full depth restoration;
- Table 4 – applicable to sites with potable groundwater and stratified restoration;
- Table 5 – applicable to sites with non-potable groundwater and stratified restoration;
- Table 6 – applicable to sites with potable groundwater and shallow soils;
- Table 7 – applicable to sites with non-potable groundwater and shallow soils;

- Table 8 – applicable to sites with potable groundwater and that are within 30 m of a water body; and,
- Table 9 – applicable to sites with non-potable groundwater and that are within 30 meters (m) of a water body.

For assessment purposes, EXP selected the MECP (2011) Table 1: Full Depth Background SCS for Residential/Parkland/Institutional/Commercial/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the "Table 1 SCS"). The selection of this category was based on the following factors:

- As per the requirements of Section 43.1 of O. Reg. 153/04, a property is considered to be a "shallow soil property" if 1/3 or more of the property consists of soil equal to or less than 2 m in depth beneath the soil surface. More than 1/3 of the boreholes advanced at the Site indicated an overburden thickness greater than 2 m, and as such, the Site is not considered as a "shallow soil property";
- The Site was considered as a sensitive Site as defined by O. Reg. 153/04 on the following basis:
  - The Site is located on or within 30 m of an area of natural significance as defined in O. Reg. 153/04. Based on the review of available resources from the Ministry of Natural Resources and Forestry website, a wetland is located northwest adjacent to the Site, extending slightly onto northern portion of the Site. The wetland is associated with Four Mile Creek. Based on the *Town of Niagara-on-the-Lake Official Plan (2017),* this wetland is understood to be a provincially significant wetland;
  - According to Schedule C of the *Town of Niagara-on-the-Lake Official Plan (2017),* the Site is adjacent to a Conservation Area;
  - Six (6) surface soil samples and six (6) subsurface soil samples, including one (1) Quality Assurance and Quality Control (QA/QC) field duplicate (BH7-SS11 and BH7-S11-0), were submitted for pH analysis. The pH of all soil samples ranged from 6.87 to 11.4. As such, the pH of surface soils at the Site is considered to be a "Sensitive Site" as per O. Reg. 153/04, Section 41; and,
  - The Site is located within 30 m of a water body.
- The stratigraphy of the Site predominantly consists of medium to fine textured soil, based on the borehole logs for the Site, where native soils were identified as silty clay to clayey silt;
- Based on the ERIS database records and Ontario Well Records, one (1) domestic well was identified within the study area;
- The Site is intended to be utilized for mixed residential and commercial land use, with residential land use as the most sensitive land use; and,
- There was no intention to carry out a stratified restoration at the Site.

3 Background Information

3.1 Physical Setting

The following physiographic, geological and soil maps were reviewed:

- Topographic Map available at the Natural Resources Canada (NRC) website http://atlas.gc.ca/toporama/en/index.html
- Make A Map: Natural Heritage Areas at Ontario Ministry of Natural Resources and Forestry website https://www.lioapplications.lrc.gov.on.ca/Natural_Heritage/index.html?viewer=Natural_Heritage.Natural_Heritage&locale=en-CA
- "Quaternary Geology, Seamless coverage of the Province of Ontario"; Data Set 14 - Revised, Scale 1: 1,000,000 Issued 2000.
- "Bedrock Geology of Ontario, Southern Sheet," Ontario Geological Survey, MDR126-REV1. Scale 1:250,000. Issued 2011.
- 1876 Illustrated Historical Atlas of the Counties of Lincoln and Welland, Ont., Digital Library of McGill University.

Based on the review of the above maps, the following information was obtained:

- Based on the information available at this time, the direction of groundwater flow in the area of the Site is to the northwest. The Lower Virgil Reservoir is located approximately 5 metres west of the Site. The Lower Virgil Reservoir is part of the Four Mile Creek which is located approximately 10 metres northwest of the Site, and flows north towards Lake Ontario.
- Based on the review of available resources from the Ministry of Natural Resources and Forestry website, a wetland is located northwest adjacent to the Site, extending slightly onto the Site. The wetland is associated with the Four Mile Creek. Based on the *Town of Niagara-on-the-Lake Official Plan (2017)*, this is understood to be a provincially significant wetland.
- The Site and surrounding areas are dominated by Iroquois Plain deposits that consist predominantly of clay to silt-textured till (derived from glaciolacustrine deposits or shale) with Modern alluvial deposits consisting of clay, silt, sand, and gravel in the western-most portion of the Site.
- The bedrock in the general area of the Site is part of a group belonging to the Queenston Formation, primarily consisting of shale, limestone, dolostone and siltstone.
- Based on the Ontario Geological Survey (OGS) Bedrock Geology Database, depth to bedrock at the Site is approximately 19 metres below ground surface (mbgs).
- According to the historical map, the Site was located within the property owned by John A. Wilson and was used for agricultural purposes including an orchard/vineyard at the southern portion.

According to Schedule C of the *Town of Niagara-on-the-Lake Official Plan (2017),* the Site is listed as a Service Commercial Area and is adjacent to a Conservation Area. The Site is included in a Wetlands Area (including adjacent lands). According to Part 3 – Land Use Policies, the Four Mile Creek estuary is understood to be a provincially significant wetland.

3.2 Past Environmental Investigations

The following reports were available for review at the time of this Phase Two ESA.

Table 3.2: Previous Reports Summary

Date	Report Title	Prepared For	Prepared By	Findings of Areas of Potential Environmental Concern
September 2021	*Phase I Environmental*	Ball Land Developments	Englobe Corp.	• The site is developed with a one story residential dwelling and one slab-on-grade

Date	Report Title	Prepared For	Prepared By	Findings of Areas of Potential Environmental Concern
	Site Assessment, 1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario			building that is utilized as a former marine (boat) repair shop originally built circa 1950-1960s. The site is bordered by woodland, residential, and a creek reservoir, beyond which are industrial/commercial. • There are two USTs previously associated with the site, one (1) located southeast of the shop and one (1) west of the residential dwelling. Both USTs were determined to be potential environmental concerns (PCAs). • There were deleterious fill materials in piles at the northern portion of the site at the time of site visit. According to a site representative, the fill material in the form of slag from a nearby former General Motors plants was historically imported as fill material. • An environmental subsurface investigation to assess the quality of the soil and groundwater on the site was recommended.
November 17, 2023	*Phase I-II Environmental Site Assessment, 1544 and 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario*	Andres Bell Construction Ltd.	Paterson Group	• A Phase I ESA was completed for the property and adjacent properties. • The site was historically and currently used as a service garage for construction and marine vehicles. • The site has been noted for the presence of former USTs. There was also evidence of the importation of fill of poor quality. • Five (5) boreholes (BH1-23 to BH5-23) were advanced on the Phase II Property on September 25, 2023. • The soil and groundwater samples were compared to the MECP Table 8 Standards for a residential/parkland/institutional land use, which was deemed to be the appropriate site condition standards, at the time. • A total of five (5) soil samples were submitted to Paracel Laboratories for analysis of a combination of one or more of metals, pH, polcyclic aromatic hydrocarbons (PAHs), benzene, toluene, ethylbenzene, and xylenes (BTEX), and petroleum hydrocarbons (PHCs) fractions F1 to F4. • One of the analyzed soil samples (BH1-SS3) was found to have concentrations of PHC fractions F2, F3, and F4 above the acceptable Table 8 site standards. • Two of the boreholes (BH3-23 and BH4-23) were noted to have visual and olfactory signs of

Date	Report Title	Prepared For	Prepared By	Findings of Areas of Potential Environmental Concern
				possible contamination found at 0.7 – 1.45 mbgs; however, no exceedances were identified. • Groundwater samples were recovered from two of the three monitoring wells (BH1-23 and BH5-23) on October 5, 2023. • The groundwater samples were submitted to Paracel Laboratories for analysis of volatile organic compounds (VOCs) (including BTEX), PAHs, and PHCs. • There were no groundwater exceedances identified above the selected MECP Table 8 standards. • It was recommended that the impacted soil/fill does not pose a risk to the current on-site activities, however they do pose a liability to the property in the form of future cost to remediate and the future filing of an RSC. • An assessment determined that future remediation would consist of the area around the former underground fuel storage tank and would generate approximately 70 m^3 of contaminated soil, and the area where imported fill was identified would generate approximately 1,000 m^3 to 1,600 m^3 of impacted fill material.
October 7, 2024	Phase One Environmental Site Assessment, 1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario	On The Lake Developments Inc.	EXP Services Inc.	• As the property is being developed to a more sensitive land use (from commercial to residential), a RSC in accordance with Ontario Regulation 153/04 will be required. The objective of the investigation was to support the filing of an RSC, and was completed in accordance with Ontario Regulation 153/04, as amended (O.Reg.153/04). • Several APECs were identified on the Site. As such, an RSC cannot be filed based on the Phase One ESA alone. • A Phase Two ESA is required to investigate the APECs identified in this Phase One ESA prior to filing an RSC based on the proposed future land use. • Five (5) APECs were identified on the site: 1. former equipment and marine vehicle repairs, 2. importation of fill material, 3. former USTs, 4. historical orchard/vineyard, and 5. vent/fill pipes at residential structure.

Based on the findings of the recent Phase One ESA and previous investigative work, PCAs were identified which result in APECs on the Site. The APECs and historical soil exceedances identified require further investigation, for the purpose of filing a RSC. EXP also wanted to conduct their own sampling program and confirm soil and groundwater concentrations at the Site, in advance of the remediation program, risk assessment and/or RSC submission.

4 Scope of the Investigation

4.1 Overview of Site Investigation

The objective of this Phase Two ESA was to assess the APECs identified in the Phase One ESA (EXP, 2024), to characterize the Site. The scope of work for the Phase Two ESA was as follows:

- Preparation of a site-specific Health and Safety Plan;
- Requesting, obtaining, and reviewing public utility locates prior to the Phase Two investigation field work;
- Retaining a subcontractor to locate on-site private utility locates prior to the Phase Two investigation field work;
- Oversee a licensed drilling company to advance a total of eight (8) exterior boreholes (identified as BH1 to BH8) to a maximum depth of 11.28 mbgs. Please note that the drilling investigation was carried out as part of a combined geotechnical/environmental/hydrogeological investigation and that not all borehole locations were utilized for environmental purposes;
- Instrument three (3) of the boreholes with groundwater monitoring wells (BH3, BH4, and BH7);
- Inspecting soil and groundwater conditions and sampling new boreholes and new and existing monitoring wells;
- Field screening of all recovered soil samples for the presence of environmental impact (i.e. petroleum vapours, chemical staining, or odours);
- Submitting selected soil samples for laboratory analysis of the potential contaminants of concern (COCs), including PHCs, BTEX, VOCs, PAHs, metals, inorganic parameters, organochlorine pesticides (OCPs) and polychlorinated biphenyls (PCBs);
- Monitoring and measuring groundwater levels in the monitoring wells to determine groundwater elevations and groundwater flow direction;
- Submitting groundwater samples from select previously installed monitoring wells BH1-23, BH2-23, and BH5-23 and the newly installed monitoring wells BH3, BH4, and BH7 for laboratory analysis of the potential COC, including PHCs, BTEX, VOCs, PAHs, metals, and inorganic parameters;
- Conducting soil and groundwater sampling in accordance with the MECP Guidance on Sampling and Analytical Methods for Use at Contaminated Site in Ontario, dated December 1996;
- Following Standard Operating Procedures (SOPs), and Quality Assurance and Quality Control (QA/QC) measures to ensure defined quality standards were met;
- Determining the appropriate SCS in accordance with O. Reg. 153/04 and comparing the results of the soil and groundwater analyses to these Standards; and,
- Reviewing data from the previous investigations (Englobe, 2021; Paterson Group, 2023), documenting the results of the current investigation, and incorporating it as a part of the Phase Two ESA.

EXP personnel who conducted assessment work for this project included Ms. Amanda Catenaro (QP_{ESA}), Ms. Kate Miles, and Ms. Jaimesyn Patterson. An outline of their qualifications is provided in Appendix C.

4.2 Media Investigated

The Phase Two ESA included the investigation of the Site soil and groundwater quality within the APECs, identified during the Phase One ESA (EXP, 2024). As there were no surface water bodies on the Site, sediment sampling was not required.

4.3 Deviations from Sampling and Analysis Plan (SAAP)

The field investigative, sampling program, and supplemental sampling program was carried out following the requirements of the Site Sampling and Analysis Plan (SAAP) in Appendix D.

Groundwater could not be sampled at monitoring wells BH3 and BH7 at the time of the first round of groundwater sampling. Both wells were dry during the October sampling event due to slow recharge of the silty clay to clayey silt they were installed in. During supplemental investigations on November 21 (Round 2) and December 2, 2024 (Round 3), groundwater samples were successfully obtained from monitoring wells BH3 and BH7. No additional deviations from the SAAP were reported that could affect the sampling and data quality objectives for the Site.

4.4 Impediments

The entire Site was accessible at the time of the investigation, and no physical impediments were encountered during the field investigation with the following exception:

The location and BH3 could not be advanced directly beside the on-Site residential dwelling at the southeastern corner of the Site due to the current occupancy. As such, BH3 was advanced to the north of the residential dwelling, but still within APEC 5 (vent pipes and a potential UST). As such, this impediment is not anticipated to affect the conclusions of the Phase Two ESA.

5 Phase One Conceptual Site Model

Following a review of the historical documentation, previous investigation, and the Site reconnaissance during the Phase One ESA, it is possible to formulate an initial Conceptual Site Model (CSM). The CSM is a simplification of reality, which aims to provide a description and assessment of any areas where a potentially contaminating activity (PCA) on or potentially affecting the Phase One property has occurred, and any COCs.

A CSM was developed based on the findings of the Phase One investigation, completed in accordance with O. Reg. 153/04.

The Site was first developed with a residential house in the northern portion and orchard or vineyard in the southern portion prior to 1876. A second residential dwelling was constructed circa 1956 in the southern portion of the Site (current residential structure at 1544 Four Mile Creek Road) and a garage structure (current structure at 1546 Four Mile Creek Road) was constructed in the northern portion circa 1964. The garage structure was used for equipment and marine vehicle repairs. The original residential house was demolished prior to 2000. The Site currently consists of one (1) residential structure in the southeastern portion and one (1) vacant garage structure (formerly used for marine vehicle repairs) in the central portion.

Nineteen (19) PCAs were identified within the Phase One Study Area (i.e. 250 metres from the property boundary). Six (6) on-Site PCAs were considered to result in APECs (the Site-specific PCA # is presented after the identified APEC below).

Refer to the table below and Figure 2 for the list of potentially contaminating activities (PCAs) that have occurred within the Phase One Study Area, which includes the Site and properties within 250 m radius of the Site boundaries.

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
Site (On-Site PCAs)					
1	1544 Four Mile Creek Road	On-Site	#27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Based on the previous report and city directories, a marine repair shop operated in the on-Site garage from approximately 1964 until 2023.	Yes
2A	1544 Four Mile Creek Road	On-site	#30 - Importation of Fill Material of Unknown Quality	Based on the previous report, slag from the former General Motors Plant was historically imported to the northern portion of the Site.	Yes
2B	1544 Four Mile Creek Road	On-site	#Other – De-icing Activities	De-icing activities have likely occurred along roadways, driveways, the parking spots and pathways at the Site.	Yes

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
3	1544 & 1546 Four Mile Creek Road	On-Site	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the previous report, two (2) USTs were reportedly historically located southeast of the garage structure and west of the residential building.	Yes
4	1544 & 1546 Four Mile Creek Road	On-Site	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	Based on 1876 historic map, an orchard/vineyard was located at the southern portion of the Site.	Yes
5	1546 Four Mile Creek Road	On-Site	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the previous report and current site inspection, vent/fill pipes were observed at the northern portion of the residential house, indicating a potential fuel oil AST/UST.	Yes
Surrounding Properties (Off-Site PCAs)					
6	n/a	30 metres east	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	Based on the aerial photographs, an orchard/vineyard was located east of the Site.	No, based on the cross-gradient location relative to the Site.
7	1579 Four Mile Creek Road	40 metres north	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents)	Based on the ERIS report and city directories, Niagara Fruit & Vegetable Growers Ltd. was listed as a wholesale	No, based on the cross-gradient location relative to the Site.

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
			Manufacturing, Processing, Bulk Storage and Large-Scale Applications	pesticide vendor, and was located at the property between 2006 and 2023.	
8a	1593 Four Mile Creek Road	70 metres northeast	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the ERIS report, The Town of Niagara-on-the-Lake Works yard is registered as a private fuel outlet with two (2) gasoline USTs and one (1) diesel UST.	No, based on the cross-gradient location relative to the Site.
8b	3 Lorraine Street	70 metres northeast	#other - spill	Based on the ERIS report, two spills occurred at the Town Works Yard; an unknown volume of gasoline in 2008 and 50 litres of diesel in 1988.	No, based on the cross-gradient location relative to the Site.
8c	1593 Four Mile Creek Road/3 Lorraine Street	70 metres northeast	#52 – Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems.	Based on the ERIS report, this property was listed as a waste generator for the Town Works Yard (believed to be related to equipment repair activities) since 1986.	No, based on the cross-gradient location relative to the Site.
9	1593 Four Mile Creek Road	70 metres northeast	#58 – Waste Disposal and Waste Management, including thermal treatment, landfilling and transfer of waste, other than use of biosoils as soil conditioners.	Based on the ERIS report, this property was listed as a waste generator for a waste collection operation since 2007.	No, based on the cross-gradient location relative to the Site.
10a	1487 Niagara Stone Road	145 metres north	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the ERIS report and city directories, a gasoline	No, based on the cross-gradient location relative to the Site.

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
				station has been located at this property since 1988.	
10b	Corner of Lorraine Road and Four Mile Creek Road	145 metres north	#other - spill	Based on the ERIS report, a gasoline spill of unknown volume occurred at the property.	No, based on the cross-gradient location relative to the Site.
10c	Lorraine Road and Four Mile Creek Road	145 metres north	#other - spill	Based on the ERIS report, a mercury spill occurred at this property.	No, based on the cross-gradient location relative to the Site.
11	7 Henegan Road, Niagara-On-The-Lake	155 meters west	#27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Based on the city directories, Whirlpool Jet Boat Tours has been located at the property since 2006. There is potential for boat maintenance and repair activities in the building.	No, based on the cross-gradient location relative to the Site.
12	11 Henegan Road, Niagara-On-The-Lake	160 metres west	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, multiple woodworking companies have been located at the property since 2006.	No, based on the downgradient location relative to the Site.
13	13 Henegan Road, Niagara-On-The-Lake	165 metres southwest	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, multiple woodworking companies have been located at the property since 2009.	No, based on the downgradient location relative to the Site.
14	15 Henegan Road, Niagara-On-The-Lake	220 metres southwest	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, Millbrook Cabinetry Inc. has been located at the property since 2006.	No, based on the downgradient location relative to the Site.

(1) Distances are approximate. Precise distances are not possible due to the age of some listings and the aggregation and/or loss of addresses.
(2) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg 153/04, as amended) that is occurring or has occurred in a phase one Study area.

Based on the evaluation of the PCAs located within the Phase One Study Area, the following areas of potential environmental concern (APECs) were identified, as presented in Figure 4 and the table below.

Area of Potential Environmental Concern (APEC)[1]	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)[2]	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern	Media Potentially Impacted (Groundwater, soil and/or sediment)
APEC 1: Former equipment and marine vehicle repairs	Central portion of the Site	PCA 1: #27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil and Groundwater
APEC 2: Importation of Fill Material	Northern portion of the Site	PCA 2: #30 - Importation of Fill Material of Unknown Quality	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg, EC, SAR, PCBs	Soil
APEC 2B: De-icing Activities	Northern portion of the Site	PCA 2B: #Other – De-icing Activities	On-Site	EC, SAR	Soil
APEC 3: Former USTs	Central portion of the Site	PCA 3: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, VOCs, Metals, Sb, As, Se	Soil and Groundwater
APEC 4: Historical orchard/vineyard	Southern portion of the Site	PCA 4: #40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	On-Site	OCPs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil
APEC 5: Vent/fill pipes at residential structure	Central portion of the Site	PCA 5: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, PAHs, VOCs	Soil and Groundwater

(1) Area of Potential Environmental Concern means the area on, in or under a phase one study area where one or more contaminants are potentially present, as determined through the PI ESA, including through (a) identification of post or present uses on, in or under the phase one property, and (b) identification of potentially contaminating activities.

(2) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg.153/04, as amended) that is occurring or has occurred in a phase one Study area.
PHCs – Petroleum Hydrocarbons; BTEX – Benzene, Toluene, Ethylbenzene, and Xylene; VOCs – Volatile Organic Compounds; PAHs – Polycyclic Aromatic Hydrocarbons; Metals – Metals (including Hydride Metals); ORPs – Other Regulated Parameters [EC - electrical conductivity; SAR - sodium adsorption ratio; Hg – mercury; CN – cyanide; B-HWS – boron (hot-water-soluble); CrVI - hexavalent chromium; and pH]; OC pesticides – Organochlorine pesticides; PCBs – polychlorinated biphenyls.

Based on the ministry of Natural Resources and Forestry's "Make a Map: Natural Heritage Areas", the site is located within 30m of the following:

- A wetland is located northwest adjacent to the Site, extending slightly onto the Site. The wetland is associated with the Four Mile Creek. Based on the Ministry of Natural Heritage is it confirmed to be a non-provincially significant wetland.

According to Schedule C of the *Town of Niagara-on-the-Lake Official Plan (2017),* the Site is listed as a Service Commercial Area and is adjacent to a Conservation Area. The Site is included in a Wetlands Area (including adjacent lands). According to Part 3 – Land Use Policies, the Four Mile Creek estuary is understood to be a provincially significant wetland. However, Niagara Peninsula Conservation Authority has confirmed that no wetland is present within the Site boundaries.

The following physiographic, geological and soil maps were reviewed:

- Topographic Map available at the Natural Resources Canada (NRC) website http://atlas.gc.ca/toporama/en/index.html
- Make A Map: Natural Heritage Areas at Ontario Ministry of Natural Resources and Forestry website https://www.lioapplications.lrc.gov.on.ca/Natural_Heritage/index.html?viewer=Natural_Heritage.Natural_Heritage&locale=en-CA
- "Quaternary Geology, Seamless coverage of the Province of Ontario"; Data Set 14 - Revised, Scale 1: 1,000,000 Issued 2000.
- "Bedrock Geology of Ontario, Southern Sheet," Ontario Geological Survey, MDR126-REV1. Scale 1:250,000. Issued 2011.
- 1876 Illustrated Historical Atlas of the Counties of Lincoln and Welland, Ont., Digital Library of McGill University.

Based on the review of the above maps, the following information was obtained:

- Based on the information available at this time, the direction of groundwater flow in the area of the Site is to the northwest. The Lower Virgil Reservoir is located approximately 5 metres west of the Site. The Lower Virgil Reservoir is part of Four Mile Creek which is located approximately 10 metres northwest of the Site, and flows north towards Lake Ontario.
- Based on the review of available resources from the Ministry of Natural Resources and Forestry website on September 17, 2024, a wetland is located northwest adjacent to the Site, extending slightly onto the Site. The wetland is associated with the Four Mile Creek. Based on the *Town of Niagara-on-the-Lake Official Plan (2017),* this is understood to be a provincially significant wetland.
- The Site and surrounding areas are dominated by Iroquois Plain deposits that consist predominantly of clay to silt-textured till (derived from glaciolacustrine deposits or shale) with Modern alluvial deposits consisting of clay, silt, sand, and gravel in the western-most portion of the Site.
- The bedrock in the general area of the Site is part of a group belonging to the Queenston Formation, primarily consisting of shale, limestone, dolostone and siltstone.
- Based on the OGS Bedrock Geology Database, depth to bedrock at the Site is approximately 19 mbgs.
- According to the historical map, the Site was located within the property owned by John A. Wilson and was used for agricultural purposes including an orchard/vineyard at the southern portion.

The investigation undertaken by EXP with respect to this report and any conclusions or recommendations made in this report reflect EXP's judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. EXP has confirmed neither the completeness nor the accuracy of the records that were provided by others; as such, the historical records review is identified as a potential source

of uncertainty during the investigation. The CSM is developed using multiple lines of evidence, searches and source information to make every reasonable attempt to ensure that findings of environmental significance are captured.

Any uncertainty or absence of information in the records review, interviews, and site reconnaissance components of the Phase One investigation are not anticipated to materially affect the validity of the CSM or Phase One conclusions.

6 Investigation Method

6.1 General

EXP performed the Phase Two ESA following the requirements of O. Reg. 153/04, Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario (MECP, 1996), and in accordance with generally accepted professional practices.

EXP followed standard operating procedures (SOPs) and QA/QC measures to ensure defined quality standards were met.

6.2 Drilling and Test Pitting Program

Prior to the commencement of drilling activities, the locations of underground utilities including cable, telephone, natural gas, electrical lines, as well water, sewer, storm water and sanitary lateral conduits were marked out by public locating companies. In addition, a private utility locating service was also retained to clear the individual borehole locations.

Between September 24th and September 26th, a total of eight (8) boreholes (BH1 to BH8) were advanced at the Site to a maximum depth of 11.28 mbgs by a licensed well contractor, Terra Firma Environmental Services Ltd. (Terra Firma), under the full-time supervision of EXP staff. Three (3) of the boreholes were instrumented with a groundwater monitoring well (BH3, BH4, and BH7).

The location of the boreholes and monitoring wells are shown in Figure 5A.

Soil samples were collected as the drilling progressed and were examined for geologic information and for physical evidence of chemical impact. One worst-case soil sample was selected from the boreholes for laboratory analysis. The soil samples selected for laboratory analysis were immediately placed into laboratory prepared glass jars, labelled, and stored in a cooler with ice at less than 10˚C. Typically, a deeper soil sample was collected, preserved, and submitted for analysis for vertical delineation purposes if the worst-case soil sample was found to exceed the applicable Standards for any of the parameters analyzed. Field duplicate samples were collected for QA/QC purposes during the soil sampling.

EXP continuously monitored the drilling activities to record the physical characteristics of soil, depth of soil sample collection and total depth of boreholes. Field observations are summarized on the borehole logs provided in Appendix E. Representative soil samples were recovered from the boreholes using split spoon sampling.

6.3 Soil Sampling

The soil sampling conducted during the completion of this Phase Two ESA was undertaken in accordance with the SAAP presented in Appendix D, to ensure that soil quality in the APECs identified in the Phase One ESA were characterized in accordance with O. Reg. 153/04.

Soil samples for geologic characterization and chemical analysis were collected on a continuous basis in the overburden materials using sampling equipment advanced from grade surface to maximum termination depth of 11.28 mbgs. The soil cores were extracted from the samplers upon retrieval by drilling personnel. Geological details of the recovered cores were logged by EXP field staff and samples were collected from selected cores samples for chemical analysis. Field observations are summarized on the borehole logs provided in Appendix E.

Measures were taken in the field and during transport to preserve sample integrity prior to chemical analysis. Recommended volumes of soil samples selected for chemical analysis were collected from the recovered cores into pre-cleaned, laboratory-supplied glass sample jars/vials identified for the specified analytical test group. Samples intended for PHC fraction F1 and VOCs were collected using a laboratory-supplied soil core sampler or syringe, placed into the vials containing methanol for preservation purposes and sealed using Teflon lined lids.

Soil samples selected for laboratory analysis were placed in clean coolers containing ice prior to and during transportation to the subcontract, AGAT Laboratories (AGAT) of Mississauga, Ontario. The samples were transported/submitted within the acceptable holding time to AGAT following Chain of Custody protocols for chemical analysis.

Decontamination and other protocols were followed during sample collection and handling to minimize the potential for sample cross-contamination. New disposal nitrile gloves were used for the handling and sampling of each retrieved soil core. The sampling equipment (i.e. split spoon, trowel) was decontaminated between monitoring well/test hole locations by the drilling contractor using a potable water/phosphate-free detergent solution followed by rinses with potable water and de-ionized water. Wash and rinse waters were disposed of on the ground. Soil cuttings from the drilling investigation were placed in labeled, sealed drums upon completion of the sampling. The drums are to be disposed of by a licensed private contractor upon completion of the on-Site activities.

Soil samples submitted for specific chemical analysis were selected on the basis of visual inspection, RKI Eagle readings, sample location and/or depth interval.

6.4 Field Screening Measurements

Readings of the petroleum vapour concentrations in soil samples collected during the drilling investigation were measured using an RKI Instruments Eagle 2, if there were sufficient recovery. This instrument is designed to detect and measure concentrations of combustible gas in the atmosphere. It is equipped with two ranges of measurement, reading concentrations in parts per million by volume (ppmv) or in percentage lower explosive limit (LEL). The RKI Eagle 2 instrument can determine combustible vapour concentrations in the range equivalent to 0 ppmv to 11,000 ppmv of hexane, with the latter number equaling 100% LEL for hexane. The instrument was configured to eliminate any response from methane for all sampling conducted at the Site. Instrument calibration is checked on a daily basis in the LEL range using standard gases comprised of a known concentration of hexane in air. If the instrument readings are within ±10% of the standard gas value, then the instrument is deemed to be calibrated, however if the readings are greater than ±10% of the standard gas value then the instrument is re-calibrated prior to use. The vapour concentrations are accurate to within ±5% of reading or ±2% LEL (whichever is greater) in the 0-100% LEL range and to within ±50 ppm or ±10% of reading (whichever is greater) in the 0-50,000 ppm range.

The measured petroleum vapours were detected up to a maximum reading of 620 ppm in samples where there was sufficient recovery to perform vapour measurements. Sample selection for laboratory analysis was determined based on visual observation, odour, and petroleum vapour readings from the RKI Eagle 2.

The field screening measurements, in parts per million (ppm) isobutylene and hexane equivalents, are presented on the borehole logs in Appendix E. It should be noted that field measurements are for screening purposes only and the presence/ absence of contamination is determined by laboratory analysis.

Each sample was additionally examined for visual, textural and olfactory classification at the time of sampling.

6.5 Groundwater: Monitoring Well Installation

Three (3) boreholes (identified as BH3, BH4, and BH7) advanced at the Site were instrumented with monitoring wells. The monitoring wells were installed in general accordance with the Ontario Water Resources Act – R.R.O. 1990, Regulation 903 – amended to O. Reg. 128/03, and were installed by Terra Firma, a licensed well contractor using a track-mounted drill rig between September 24 and 26, 2024.

The monitors were constructed from 50 millimetre diameter threaded Schedule 40 PVC pipe with a slot size of 0.01 inches and 2 threads per inch (TPI). The lower section of pipe is slotted above and below the water table. The upper section of the pipe is solid. The lower part of the annulus of the hole was backfilled with silica sand up to approximately 0.3 or 0.6 metres above the top of the slotted section. A bentonite seal, a minimum of 0.6 metres thick was placed above the sand to just below grade.

Bentonite and concrete were used to seal the monitors at grade. Each monitor is equipped with a protective flush-mount casing and locking lid.

EXP continuously monitored the well installation activities. Well installation details are summarized in borehole logs provided in Appendix E.

When the monitoring wells are no longer required, they must be decommissioned in accordance with the procedure outlined in the Ontario Water Resources Act - R.R.O. 1990, Regulation 903 - amended to O. Reg. 128/03.

Proper field sampling procedures as documented in Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario (MOE, 1996), including decontamination of sampling equipment, were followed to minimize the potential for cross-contamination. Measures taken to minimize the potential for cross contamination or the introduction of contaminants during well construction included:

- The use of well pipe components (e.g. riser pipe and well screens) with factory machined threaded flush coupling joints;
- Construction of wells without the use of glues or adhesives;
- Removing the protective plastic wraps from well components at test hole insertion to prevent contact with the ground and other surfaces; and,
- Cleaning of augers between sampling locations.

The location of the groundwater monitors is shown in Figure 5A.

6.6 Monitoring Well Development

Following the installation of monitoring wells, the monitoring wells were developed to remove fine sediment particles from the sand pack and enhance hydraulic communication with the surrounding formation waters.

The monitors were developed by removing a minimum of three well volume equivalents of groundwater or purging to dryness using a dedicated bailer. Purge water was examined for any liquid petroleum hydrocarbon sheen or odour. Purge water was collected and stored on-Site in labeled, sealed containers, until properly managed or disposed off-Site.

Well purging details were documented on a log sheet or in a bound hard cover notebook.

6.7 Groundwater Field Measurements of Water Quality Parameters

Immediately prior to collecting the groundwater samples, the wells were purged in accordance until field stabilization parameters indicated that stable aquifer conditions had been reached. The peristaltic pump was then used to collect the groundwater samples with low-flow sampling techniques.

Water quality parameters (pH, specific conductance (EC), total dissolved solids (TDS), oxidation-reduction potential (OP), and temperature) were measured using a HI 991301 pH/EC/TDS Multi-parameter Meter. The pH (two-point calibration) and EC are calibrated prior to use. The meter detects pH in the range of 0.00 to 14.00 ±0.01 pH, EC from 0 to 3,999 µS/cm ±2% full scale (F.S.), TDS from 0 to 2,000 ppm (mg/L) ±2% F.S., and temperature from 0.0 to 60.0˚C ±0.5˚C.

All development and purged water were collected and stored on-Site in labeled, sealed containers, until properly managed or disposed off-Site. Water quality parameters were recorded on log sheets or in a bound field book.

6.8 Groundwater Sampling

Groundwater sampling was conducted at the three (3) newly installed monitoring wells (BH3, BH4, and BH7) and three (3) pre-existing wells (BH1-23, BH2-23, and BH5-23). During the first groundwater monitoring event in October 2024 (round 1), only one (1) newly installed well (BH4) was accessible for groundwater monitoring due to the other two (2) (BH3 and BH7) being dry at the time of the investigation. The newly installed wells BH3 and BH7 were dry during the initial October sampling event, however they were able to be sampled during both supplemental sampling events on November 21 (round 2) and December 2, 2024 (round 3). All six (6) monitoring wells were successfully sampled across investigation events.

Recommended groundwater sample volumes were collected into pre-cleaned laboratory-supplied vials or bottles provided with analytical test group specific preservatives, as required. The samples were placed in an insulated cooler pre-chilled with ice at less than 10˚C immediately upon collection. Samples for VOCs and/or PHC F1 analysis were collected in triplicate vials prepared with concentrated sodium bisulphate as a preservative. Each VOC/PHC vial was inverted and inspected for gas bubbles prior to being placed in the cooler to ensure that no head-space was present in the samples. Samples for Inductively Coupled Plasma Mass Spectrometry (ICPMS) metals were collected using disposable 0.45 micron field filters.

The groundwater samples were assigned a unique identification number, and the date, time, project number, company name, location and requested analyses were documented in a bound hard cover notebook. All groundwater samples were placed in clean coolers containing ice prior to and during transportation to the subcontract laboratories, AGAT. The samples were transported/submitted following appropriate holding time requirements following Chain of Custody protocols for chemical analysis.

Decontamination and other protocols were followed during sample collection and handling to minimize the potential for sample cross-contamination. New disposable nitrile gloves were used at each monitoring well location.

Appropriate QA/QC samples were collected during groundwater sampling, including field duplicate samples and trip blanks, where required.

6.9 Sediment Sampling

As no water body was present at the Site, sediment sampling was not undertaken during the Phase Two ESA.

6.10 Analytical Testing

All laboratory analyses were completed by AGAT, accredited laboratories located in Mississauga, Ontario. AGAT performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the document entitled *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act* (March 9, 2004, amended as of July 1, 2011).

6.11 Residue Management Procedures

Multiple drums of soil cuttings and purge water generated during the drilling/groundwater sampling activities are temporarily stored on-Site in sealed containers.

6.12 Elevation Survey

An elevation survey was conducted by EXP between September 24 to 26, 2024, for the boreholes advanced in 2024, with the purpose of obtaining relative vertical control of the newly installed and existing monitoring well locations. The elevations are recorded in the borehole logs in Appendix E.

A summary of the ground surface elevation for each monitoring well is provided in Table 3.

6.13 Quality Assurance and Quality Control Measures

QA/QC, as set out in the Sampling and Analysis Plan, were implemented during sample collection, storage and transport to provide accurate data representative of conditions in the surficial fill and upper overburden soils and the water table aquifer. The QA/QC measures included decontamination procedures to minimize the potential for sample cross contamination, the execution of standard operating procedures to collect representative and unbiased samples, the collection of quality control samples to evaluate sample precision and accuracy, and the implementation of measures to preserve sample integrity.

Decontamination protocols were followed during sample collection and handling to minimize the potential for cross-contamination. During the collection of soil samples, split spoon samplers were scraped and decontaminated between monitoring wells by washing with a potable water/phosphate-free detergent solution followed by a rinse with potable water. New disposable nitrile gloves were used for the handling and collection of samples from each soil core.

Soil samples selected for chemical analyses were collected from the retrieved soil cores and placed directly into pre-cleaned, laboratory-supplied glass jars or vials. Sample volumes were consistent with analytical test group requirements as specified by the receiving laboratory.

The groundwater samples were collected into pre-clean laboratory-supplied vials or bottles provided with analytical test group specific preservatives, as required. Recommended analytical test group specific sample volumes were collected as specified by the contractual laboratory. Sample vials for analysis of VOCs were inspected for the presence of gas bubbles and the presence of head space, where volatiles may partition into.

Measures were followed to preserve sample integrity between collection and receipt by the contractual laboratory. All samples, both soil and groundwater, immediately upon collection were placed in insulated coolers pre-chilled with ice for storage and transport to the contractual laboratory. Samples were received by the contractual laboratory within specific analytical test group holding time requirements.

Documentation procedures were followed to confirm sample identification and tracked sample movement. Each sample was assigned a unique identification ID number, which was recorded along with the date, time of sampling and requested analyses on labels affixed to the sampling containers, and in a bound field notebook. Chain of Custody protocols were followed to track sample handling and movement until receipt by the contractual laboratory.

A total of two (2) trip blank samples were submitted for groundwater sampling programs completed on October 2, 2024 (round 1), and November 21, 2024 (round 2).

All field instruments are calibrated on a daily basis, prior to use, as described in Sections 6.4 and 6.7.

7 Review and Evaluation

7.1 Geology

The soil investigation conducted at the Site consisted of the advancement of eight (8) boreholes, to a maximum depth of 11.28 mbgs, as part of the current investigation.

The borehole logs describing geologic details of the soil cores recovered during the Site drilling activities are presented in Appendix E. Boundaries of soil indicated on the log sheets are intended to reflect transition zones for the purpose of environmental assessment and should not be interpreted as exact planes of geological change.

The general stratigraphy at the Site, as observed in the boreholes, consists of topsoil or granular fill, underlain by silty clay to sandy silt fill, overlying native layers of clayey silt, and silty clay till (BH1). Bedrock was not encountered at the borehole completion depths, to a maximum investigative depth of 11.28 mbgs. A brief description of the soil stratigraphy at the Site, in order of depth, is summarized in the following sections. Refer to borehole logs provided in Appendix E for details of soil stratigraphy.

7.1.1. Surficial Material

Surficial topsoil was encountered at BH2, BH3, BH4, BH5, BH7, and BH8, with a thickness ranging from 50 to 150 mm. BH7 encountered approximately 200 mm of granular fill beneath the surficial topsoil layer.

BH1 and BH6 were advanced in the gravel driveway and encountered approximately 250 and 450 mm of surficial granular fill.

The granular fill typically consisted of crushed limestone.

7.1.2. Fill Material

Fill material was encountered at all borehole locations beneath the surficial material, except for BH2 and BH3, extending from approximately 0.8 to 9.14 mbgs. Fill material consisted of silty clay, gravelly sand, silty sand, or sandy silt, and was noted to contain trace to some organics, trace wood, brick, and asphalt fragments, and deleterious materials.

7.1.3. Native Soils

A native deposit of silty clay was encountered at all borehole locations except for BH1, where a native sandy silt was encountered under the fill, extending from 9.14 to the borehole termination depth of 11.28 mbgs. Native silty clay was encountered directly below topsoil at BH2 and BH3, extending from approximately 0.5 to the borehole termination depth of 8.2 mbgs, and was encountered at depths ranging from 0.75 to 7.6 mbgs in BH4, BH5, BH6, BH7, and BH8.

All boreholes were terminated in native material at depths ranging from 6.71 to 11.28 mbgs. No odour or staining was identified in the native material.

7.1.4 Bedrock

Bedrock was not encountered at the boreholes advanced at the Site to the maximum investigative depth of 11.28 mbgs.

7.2 Groundwater: Elevations and Flow Direction

The monitoring well network consisted of six (6) monitoring wells (BH1-23, BH2-23, BH5-23, BH3, BH4 and BH7) screened within the fill material and native soils. On October 2, 2024 (round 1), the measured depth of the groundwater table ranged from 0.41 (BH1-23) to 1.67 (BH2-23) mbgs; the calculated groundwater elevations ranged from 90.87 (BH2-23) to 92.24 (BH1-23) masl in

the groundwater monitors. On December 2, 2024 (round 3), the measured depth of the groundwater table ranged from 0.7 (BH1-23/BH4) to 6.7 (BH3) mbgs; the calculated groundwater elevations ranged from 85.84 (BH3) to 91.95 (BH1-23) masl in the groundwater monitors. The groundwater levels and corresponding elevations are summarized in Table 3, and presented in the borehole logs provided in Appendix E.

Taking into consideration surface water features in the surrounding area (discussed in Section 3.1), the regional groundwater flow direction is inferred to be northwesterly. Localized flow conditions across the site indicate a groundwater flow to the north to northwest in the unconfined clayey silt to silty clay aquifer; groundwater contour plans are shown in Figure 6a and 6b.

Groundwater may be influenced by disturbed soil (fill), underground utilities and/or underground building structures in the area. Given the minimum depth to groundwater identified on-site of 0.41 mbgs, utility conduits may provide a preferential flow path for groundwater.

All measurements of groundwater and liquid petroleum (if any) depth were made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape that came into contact with liquids within the monitor are cleaned with Alconox detergent, and then rinsed with distilled water and methanol and allowed to air dry after each measurement.

7.2.1 Groundwater: Hydraulic Conductivity

The hydraulic conductivity for the native soil at the Site was estimated to be 1.0×10^{-7} m/s for the clayey silt to silty clay where the monitoring wells were screened.

7.2.2 Groundwater: Horizontal Hydraulic Gradients

The horizontal hydraulic gradient, between each monitoring well pair, is calculated using the following equation:

$i = \Delta h/\Delta s$

Where,

i = horizontal hydraulic gradient;

Δh (m) = groundwater elevation difference; and,

Δs (m) = separation distance.

The calculated hydraulic gradient value for the monitoring wells was an average of 0.1 m/m to 0.01 m/m to the north to northwest.

Using a value of 1.0×10^{-7} m/s for the hydraulic conductivity of the, a calculated hydraulic gradient of 0.01m/m, and 20% for effective porosity of clayey silt to silty clay (McWhorter and Sunada, 1977), Darcy's Law calculations were made to determine the potential groundwater flow velocity at the Site. The groundwater flow velocity was calculated to be approximately 0.0016 metres per year in the water-bearing clayey silt to silty clay.

7.3 Soil Texture

According to O. Reg. 153/04, to be classified as medium to fine textured soil, at least 2/3 of the soil on Phase Two Property, measured by volume, must contain 50% or more by mass of particles that are less than 75 micrometres in mean diameter.

Based on the borehole logs, the native soils are defined as silty clay to clayey silt. EXP geotechnical staff completed a grain size analysis to confirm soil texture on samples BH3- SS6 and BH7-SS7. Results show that more than 50% by mass of the samples consist of particle sizes smaller than 75 µm in diameter. BH3-SS6 indicated that approximately 87% of the sample was classified

as medium to fine textured and BH7-SS7 indicated that approximately 93% of the sample was classified as medium to fine textured. As a result, soil is classified as medium to fine textured. EXP's grain size analysis is provided in Appendix I.

7.4 Soil Field Screening

The combustible vapour readings from each sample interval were measured for all advanced boreholes, as a screening tool for soil sample selection for PHC and VOC analysis. Vapour concentration readings collected during subsurface drilling were measured using the RKI Eagle 2 calibrated with isobutylene and hexane or equivalent. The vapour readings, in ppm, are provided on the borehole logs in Appendix E.

Soil samples submitted for chemical analysis were selected on the basis of visual inspection of the recovered cores, combustible vapour readings, sample location and/or depth interval. The hexane readings were detected up to a maximum of 620 ppm.

7.5 Soil Quality

In accordance with the scope of work, chemical analyses were performed on selected soil samples recovered from the boreholes. The selection of representative "worst case" soil samples was based on field screening, visual and/or olfactory evidence of impacts, and the presence of potential water bearing zones. Copies of the laboratory Certificates of Analysis for the analyzed soil samples are provided in Appendix G. A summary of the analytical results for the soil samples collected from the current investigation, including the locations and depths of each sample, a comparison of concentrations against applicable SCS, and the identification of the potential contaminants of concern, are provided in Tables 6 to 11. The maximum concentrations detected for each of the parameters analyzed during the current Phase Two investigation are provided in Table 5.

7.5.1 Petroleum Hydrocarbons (PHCs) and Benzene, Toluene, Ethylbenzene, and Xylene (BTEX)

Eleven (11) soil samples including one (1) QA/QC field duplicate (BH7-SS3-0) were submitted for PHCs and BTEX analysis.

The concentrations of all PHC and BTEX in the analyzed soil samples were either detected below the applicable Table 1 SCS or the laboratory RDLs with the following exception:

- Exceedances of PHC fraction F2 at BH4-SS3 (depth of 1.52 to 2.13 mbgs); A deeper sample, BH4-SS7 (depth of 6.09 to 6.70 mbgs), was submitted from this location and was within the Table 1 SCS for BTEX and PHCs;

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 6 and Figure 7.

7.5.2 Volatile Organic Compounds (VOCs)

Eleven (11) soil samples including one (1) QA/QC field duplicate (BH7-SS3-0) were submitted for VOCs analysis.

The concentrations of all VOC parameters in the analyzed soil samples were either below the Table 1 SCS or not detected above the laboratory RDLs.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 7 and Figure 8.

7.5.3 Polycyclic Aromatic Hydrocarbons (PAHs)

Seven (7) soil samples including one (1) QA/QC field duplicate (BH7-SS2-0) were submitted for PAHs analysis.

The concentrations of all PAH parameters in the analyzed soil samples were either detected below the applicable Table 1 SCS or the laboratory RDLs.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 8 and Figure 9.

7.5.4 Metals (including Hydride-Forming Metals) and Other Regulated Parameters (B-HWS, Cr (VI), Hg, CN)

Seven (7) soil samples including one (1) QA/QC field duplicate (BH7-SS1) were submitted for metals (including hydride-forming metals) and seven (7) soil samples including one (1) QA/QC field duplicates (BH7-SS1) were submitted for hot water soluble boron, hexavalent chromium, mercury and cyanide.

The concentrations of all metal and ORPs (hot water soluble boron, hexavalent chromium, and mercury) parameters in the analyzed soil samples were either detected below the applicable Table 1 SCS or the laboratory RDLs.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 9 and Figure 10.

7.5.5 Electrical Conductivity and Sodium Adsorption Ratio

Eight (8) soil samples including one (1) QA/QC field duplicate (BH7-SS1) were submitted for EC and SAR.

Exceedances were identified at BH5 above the Table 1 SCS, obtained from a depth of 0 to 0.61 mbgs. A deeper delineation sampled from this location, obtained from 6.09 to 6.70 mbgs, was within the Table 1 SCS.

Based on the reported analytical results, exceedances of EC were identified at the Site. It is the Qualified Person's (QP's) opinion that the elevated concentrations of EC are associated with de-icing and salting substances routinely applied on-site during the winter months for vehicular and pedestrian safety. Therefore, as per Section 49.1 (1) of O. Reg. 153/04, which references Section 2 of Ontario Regulation 339 of the Revised Regulations of Ontario, 1990 (Classes of Contaminants – Exceptions), it is in the QP_{ESA}'s opinion that the elevated levels of EC are not exceedances of the applicable Table 1 SCS.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 9 and Figure 11.

7.5.6 Soil pH

Seven (7) surface soil samples and two (2) subsurface soil samples, including one (1) QA/QC field duplicates (BH7-SS1), were submitted for pH analysis.

A pH (surficial) outside of the range of 5-9 was identified in samples BH5-SS1 (depth of 0.0 to 0.61 mbgs) and BH1-SS1 (depth of 0.0 to 0.61 mbgs). However, as the Table 1 SCS are applicable to the Site, these pH values are in line with the application of these standards.

The results are presented in Table 9.

7.5.7 Polychlorinated Biphenyls (PCBs)

Three (3) soil samples including one (1) QA/QC field duplicate (BH1-SS1-0) were submitted for PCB analysis.

The concentrations of all PCB parameters in the analyzed soil samples were either below the Table 1 SCS or not detected above the laboratory RDLs.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 10 and Figure 12.

7.5.8 Organochlorine Pesticides (OCPs)

Five (5) soil samples including one (1) QA/QC field duplicate (BH7-SS2-0) were submitted for OCP analysis.

The concentrations of all OCP parameters in the analyzed soil samples were either below the Table 1 SCS or not detected above the laboratory RDLs.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 11 and Figure 13.

7.5.9 Chemical Transformation and Soil Contaminant Sources

The PHC Fraction F2 exceedance identified in soil at BH4 is likely associated with the historic UST formerly located on Site, located on the west side of the residential home and southeast of the garage. Previous reports also identified PHC impacts in this area (Paterson Group, 2023). Soil impacts were all located adjacent to the former UST. It is unlikely that these parameters would undergo chemical transformation with the exception of lowering concentrations via natural attenuation with time.

Chemical constituents were not detected in the soil samples. Chemical transformation is not anticipated.

7.5.10 Evidence of Non-Aqueous Phase Liquid

Inspection of the soil retrieved from the test holes did not indicate the presence of non-aqueous phase liquid (NAPL) or hydrocarbon sheen at the time of the Phase Two ESA.

7.6 Groundwater Quality

In accordance with the scope of work, chemical analyses were performed on groundwater samples recovered from six (6) monitoring wells (BH3, BH4, BH7, BH1-23, BH2-23, BH5-23).

During the first groundwater monitoring event in October 2024 (round 1), only one (1) newly installed well (BH4) was accessible for groundwater monitoring due to the other two (2) (BH3 and BH7) being dry at the time of the investigation. The four (4) accessible monitoring wells were sampled by EXP on October 2, 2024.

Supplemental groundwater sampling events were carried out on November 21 (round 2) and December 2, 2024 (round 3). Groundwater samples were obtained from previously inaccessible monitoring wells BH3 and BH7 on November 21, 2024, to assess APEC 5 (fill pipes at the north portion of the residential home on-Site), and horizontally delineate groundwater impacts, respectively. Supplemental groundwater samples were also obtained on November 21, 2024 from monitoring wells BH4, BH2-23 and BH5-23, to re-assess identified PAHs, BTEX, and metal exceedances from the first sampling event.

On December 2, 2024, supplemental groundwater samples were obtained from BH3, BH4, BH7, BH2-23 and BH5-23 to further assess identified PAH, BTEX, and metal exceedances.

Copies of the laboratory Certificates of Analysis for the analyzed groundwater samples are provided in Appendix G. A summary of the analytical results for the groundwater samples collected are provided in Tables 12 to 15. The maximum concentrations detected across all sampling events for each of the parameters analyzed are provided in Table 5.

7.6.1 Petroleum Hydrocarbons (PHCs) and Benzene, Toluene, Ethylbenzene, and Xylene (BTEX)

A total of eleven (11) groundwater samples including three (3) QA/QC field duplicates (BH4-0, BH7-0, BH5-23-0) were submitted for PHCs and/or BTEX analysis.

During the sampling, the concentrations of all PHC parameters and BTEX in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs with the following exception:

- An ethylbenzene exceedance above the Table 1 SCS was identified in BH4 (having a screen depth of 0.91 to 3.96 mbgs) on October 2, 2024. During the two consecutive rounds of groundwater sampling on November 21 (round 2) and December 2 (round 3), the concentrations of all PHC parameters and BTEX in the analyzed groundwater samples at BH4 were either detected below the applicable Table 1 SCS or the laboratory RDLs. As such, BH4 is considered to be within the Table 1 SCS for PHCs and BTEX.

The results are presented in Table 12 and Figure 14.

7.6.2 Volatile Organic Compounds (VOCs)

A total of eight (8) groundwater samples including two (2) QA/QC field duplicates (BH7-0, BH5-23-0) were submitted for VOCs analysis.

During sampling, the concentrations of all VOC parameters in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs.

The results are presented in Table 13 and Figure 15.

7.6.3 Polycyclic Aromatic Hydrocarbons (PAHs)

A total of eleven (11) groundwater samples including three (3) QA/QC field duplicates (BH4-0, BH7-0, BH5-23-0) were submitted for PAHs analysis.

During initial sampling, the concentrations of all PAH parameters in the analyzed groundwater samples were either below the Table 1 SCS or not detected above the laboratory RDLs with the following exceptions:

- PAH (anthracene, chrysene, phenanthrene, pyrene) exceedances above the Table 1 SCS was identified in BH4 (having a screen depth of 0.91 to 3.96 mbgs). During the two consecutive rounds of groundwater sampling on November 21 (round 2) and December 2 (round 3), the concentrations of all PAH parameters in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs. As such, BH4 is considered to be within the Table 1 SCS for PAHs.

The results are presented in Table 14 and Figure 16.

7.6.4 Metals (including Hydride-Forming Metals) and ORPs (including Cr(VI), CN- and Hg)

A total of fourteen (14) groundwater samples including three (3) QA/QC field duplicates (BH7-0, BH7-0, BH5-23-0) were submitted for metals and ORPs analysis.

During initial sampling in October 2024 (round 1), the concentrations of all metal and ORPs in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs with the following exceptions:

- Cobalt, nickel, selenium, uranium exceedances above the Table 1 SCS were identified in BH5-23 and its duplicate sample, BH5-23-0 (having a screen depth of 5.33 to 6.85 mbgs).

- A uranium exceedance above the Table 1 SCS was identified in BH2-23 (having a screen depth of 4.42 to 7.47).

During the November 2024 (round 2) supplemental sampling, the concentrations of all metal parameters in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs with the exception of the following;

- Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH2-23 (having a screen depth of 4.42 to 7.47), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).

- A vanadium exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).

During the December 2024 (round 3) supplemental sampling, the concentrations of all metal parameters in the analyzed groundwater samples were either detected below the applicable Table 1 SCS or the laboratory RDLs with following exceptions:

- Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).

- A vanadium and cobalt exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).

Given the two (2) consecutive clean rounds of groundwater sampling for nickel and selenium at BH5-23, these contaminants are not considered to be in exceedances of the Table 1 SCS at the Site.

The results are presented in Table 15 and Figure 17.

7.6.5 Sodium (Na) and chloride (Cl)

A total of nine (9) groundwater samples including two (2) QA/QC field duplicates (BH5-23-0, BH7-0) were submitted for sodium and chloride analysis.

During initial and supplemental sampling, the sodium and chloride were not detected above the applicable Table 1 SCS in the analyzed samples.

The laboratory RDLs are below the Table 1 SCS. The results are presented in Table 15 and Figure 18.

7.6.6 Chemical Transformation and Groundwater Contaminant Sources

The results of the current investigation did not indicate the presence of free product at any of the monitoring wells.

The ethylbenzene and PAH exceedances initially identified at BH4 were further assessed during supplemental investigations; no exceedances in PAH or BTEX were identified in groundwater samples for November (round 2) and December (round 3) events. Metal impacts initially identified at BH2-23 and BH5-23 remained present during supplemental investigations, and additional metal impacts were identified at BH3 and BH7. Cobalt and vanadium exceedances present at BH5-23 are likely associated with the equipment and marine vehicle repair shop (APEC 1). Uranium exceedances identified at BH3, BH7, BH2-23, and BH5-23 are likely associated with background conditions, representative of the bedrock and soil type in the vicinity of the Site.

No significant chemical transformations are expected.

7.6.7 Evidence of Non-Aqueous Phase Liquid (NAPL)

No evidence of NAPL was observed during groundwater monitoring, purging and sampling activities.

7.7 Sediment Quality

As no surface water body was located on-Site, the Phase Two ESA did not include sediment sampling.

7.8 Quality Assurance and Quality Control Results

Quality assurance and quality control measures were taken during the field activities to meet the objectives of the sampling and quality assurance plan to collect unbiased and representative samples to characterize existing conditions in the overburden and water table units at the Site.

Review of field activity documentation indicated that recommended sample volumes were collected from soil and groundwater for each analytical test group into appropriate containers and preserved with proper chemical reagents in accordance with the protocols set out in the "Protocol for Analytical Methods used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act" (MECP, 2004). Samples were preserved at the required temperatures in pre-chilled insulated coolers and met applicable holding time requirements, when relinquished to the receiving laboratory.

Field QA/QC samples were collected during soil and groundwater sampling. A total of four (4) soil and four (4) groundwater duplicate samples were collected to evaluate sampling precision. Two (2) trip blank samples were analyzed for VOCs.

Four (4) soil sample/field duplicate sample pair(s) were collected and analyzed for the following pCOCs:

- BH7-SS3/BH7-SS30 for PHCs/BTEX and VOCs;
- BH7-SS2/BH7-SS20 for PAHs and OCPs;
- BH7-SS1/BH7-SS10 for Metals and ORPs;
- BH1-SS1/BH1-SS1-0 for PCBs.

Four (4) groundwater sample/field duplicate sample pair were collected and analyzed for the following pCOCs:

- BH5-23/BH5-23-0 for PHCs/BTEX, VOCs, PAHs, Metals and ORPs;
- BH7/BH7-0 for PHCs/BTEX, VOCs, PAHs, Metals and ORPs;
- BH7/BH7-0 for Metal and ORPs;
- BH4/BH4-0 for PAHs and PHCs/BTEX.

The field duplicate sample results were quantitatively evaluated by calculating the relative percent difference (RPD).

For soil samples, the alert limit criteria for the field duplicate RPD is >10% for EC, >30% for PHCs, OCPs, PCBs, metals (including hydride forming metals) and ORPs (Hg and SAR), >35% for ORPs (Cr (VI) and CN-), >40% for PAHs, ORPs (B-HWS), and >50% for VOCs. The calculated RPD between the duplicate samples and the original samples for soil was below the applicable alert limit criteria for all of the parameters analyzed, with the following exceptions:

- The RPD was 33% for arsenic, 40% for copper, 33% for lead, 45% for molybdenum, 45% for zinc, and 15% for EC between sample BH7-SS1 and duplicate BH7-SS10.

Even though the calculated RPDs for metals and EC between sample BH7-SS1 and duplicate BH7-SS10 were above the alert limit criteria of 30% and 10%, respectively, this does not affect the conclusions of the Phase Two ESA as both concentrations of the samples and duplicates of the above-mentioned parameters were within the MECP (2011) Table 1: Full Depth Background Site Condition Standards (SCS) for Residential/Parkland/Institutional/Commerical/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the "Table 1 SCS"). The RPD exceedances in soil are attributed to the surficial nature of the sample (SS1) leading to soil heterogeneity; the sample was observed to contain mostly granular material and asphalt.

For groundwater samples, the alert limit criteria for the field duplicate RPD is >30% for PHCs/BTEX, VOCs, and PAHs, and >20% for metals (including hydride-forming metals) and ORPs (Hg, Cr (VI), CN-, Na and Cl). The calculated RPD between the duplicate samples and the original samples for groundwater was below the applicable alert limit criteria for all of the parameters analyzed with the following exceptions:

- The RPD was 56% for molybdenum and 49% for selenium between sample BH5-23 and duplicate BH5-23-0;
- The RPD was 27% for copper, 54% for nickel and 37% for vanadium between sample BH7 and duplicate BH7-0;
- The RPD was 49% for molybdenum and 67% for vanadium between sample BH7 and duplicate BH7-0.

Even though the calculated RPD for metals between samples BH5-23 and its duplicate BH5-23-0, BH7 and its duplicate BH7-0, and BH7 and its duplicate BH7-0, were above the alert limit criteria of 20% this does not affect the conclusions of the Phase Two ESA, as concentrations of above-mentioned parameters were within the O. Reg. 153/04 Table 1 SCS with the exception of the concentration of selenium in sample BH5-23. However, BH5-23 was re-sampled during round 2 and round 3 of groundwater monitoring and was found to be within the Table 1 SCS both times. As such, it was removed as a COC. Therefore, the conclusions are not affected, and objectives of the Phase Two ESA are considered to have been met.

The trip blanks were below the laboratory RDL for all VOCs analyzed.

Assessment of the duplicate soil and groundwater samples showed that the results generally met analytical test group specific acceptance criteria. The overall assessment indicates that the data is acceptable for meeting the objectives of the Phase Two ESA.

The subcontract laboratory used during this investigation, AGAT, is accredited by the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories in accordance with ISO/IEC 17025:1999 – "General Requirements for the Competence of Testing and Calibration Laboratories" for the analysis of all parameters for all samples in the scope of work for which SCS have been established under Ontario Regulation 153/04.

The analytical programs conducted by AGAT included analytical test group specific QA/QC measures to evaluate the accuracy and precision of the analytical results and the efficiency of analyte recovery during solute extraction procedures. The laboratory QA/QC program consisted of the preparation and analysis of laboratory duplicate samples to assess precision and sample homogeneity, method blanks to assess analytical bias, spiked blanks and QC standards to evaluate analyte recovery, matrix spikes to evaluate matrix interferences and surrogate compound recoveries (VOCs only) to evaluate extraction efficiency. The laboratory QA/QC results are presented in the Quality Assurance Report provided in the Certificate of Analysis prepared by AGAT. The QA/QC results are reported as percent recoveries for matrix spikes, spike blanks and QC standards, relative percent difference for laboratory duplicates and analyte concentrations for method blanks. The QA/QC results were assessed against test group control limits in the case of spiked blanks, matrix spikes and surrogate recoveries and alert criteria in the case of method blanks and laboratory duplicates. Review of the laboratory QA/QC results reported by AGAT indicated that they were within acceptable control limits or below applicable alert criteria for the sampled media and analytical test groups with the following exception:

- A molybdenum groundwater QA/QC lab exceedance was identified in the Lab CofA 24H204750. A method blank spike recovery was measured at 124% where the upper acceptable limit was 120%. Given that this indicates that our samples would be biased high for molybdenum and because our samples were all still within the MECP Table 1 Standards for molybdenum, for groundwater, this is not considered to affect the conclusions of the Phase Two ESA.

Based on the assessment of the QA/QC, the analytical results reported are of acceptable quality and data qualifications are not required.

7.9 Phase Two Conceptual Site Model

A Phase Two CSM provides a narrative, graphical and tabulated description integrating information related to the Site geologic and hydrogeologic conditions, areas of potential environmental concern/potential contaminating activities, the presence and distribution of potential contaminants of concern, contaminant fate and transport, and potential exposure pathways. The Phase Two CSM was completed in accordance with O. Reg.153/04 as defined by the MECP and is presented in Appendix H.

8 Conclusions

A Phase Two ESA was conducted to evaluate soil and groundwater quality within the APECs, identified during the Phase One ESA (EXP, October 7, 2024).

The results and findings of the Phase Two ESA conducted at the Site are summarized as follows:

- Between September 24 to 26, 2024 a total of eight (8) boreholes (BH1 to BH8) were advanced at the Site to a maximum depth of 11.28 mbgs by a licensed well contractor, Terra Firma Environmental Services Ltd. (Terra Firma), under the full-time supervision of EXP staff. Three (3) of the boreholes were instrumented with groundwater monitoring wells (BH3, BH4, and BH7), installed for environmental purposes. Please note that the drilling investigation was carried out as part of a combined geotechnical/environmental/hydrogeological investigation and that not all borehole locations were sampled for environmental purposes.

- The general stratigraphy at the Site was comprised of topsoil and/or granular fill, underlain by fill (silty clay to sandy silt fill), overlying native layers of silty clay, and sandy silt till (BH1). Fill material was encountered at all borehole locations, except for BH2 and BH3. Bedrock was not encountered at the borehole completion depths, to a maximum investigative depth of 11.28 mbgs.

- The monitoring well network advanced as part of this Phase Two ESA consisted of three (3) (BH3, BH4, and BH7) monitoring wells screened within the native soils. In addition, three (3) pre-existing wells (BH1-23, BH2-23, and BH5-23) installed during a previous investigation were used for groundwater monitoring.

- During the first groundwater monitoring event in October 2024 (round 1), only one (1) newly installed well (BH4) was accessible for groundwater monitoring due to the other two (2) (BH3 and BH7) being dry at the time of the investigation. The four (4) accessible monitoring wells were sampled by EXP on October 2, 2024. The measured depth of the groundwater table ranged from 0.41 (BH1-23) to 1.67 (BH2-23) mbgs during the October monitoring event; the calculated groundwater elevations ranged from 90.87 (BH2-23) to 92.24 (BH1-23) masl (metres above sea level).

- Supplemental groundwater sampling events were carried out on November 21 (round 2) and December 2, 2024 (round 3). Groundwater samples were obtained from previously inaccessible monitoring wells BH3 and BH7 on November 21, 2024, to assess APEC 5 (fill pipes at the north portion of the residential home on-Site), and horizontally delineate groundwater impacts, respectively. Supplemental groundwater samples were also obtained on November 21, 2024 from monitoring wells BH4, BH2-23 and BH5-23, to re-assess identified PAHs, BTEX, and metal exceedances in the round 1 sampling event. On December 2, 2024, supplemental groundwater samples were obtained from BH3, BH4, BH7, BH2-23 and BH5-23 to further assess identified PAH, BTEX, and metal exceedances. All six (6) groundwater monitors were checked by EXP on December 2, 2024. The measured depth of the groundwater table from round 2 and 3 ranged from 0.7 (BH1-23/BH4) to 6.7 (BH3) mbgs; the calculated groundwater elevations ranged from 85.84 (BH3) to 91.94\5 (BH1-23) masl in the groundwater monitors.

- Based on the available groundwater depth measurements and the available groundwater monitors, a groundwater contour map was generated for the Site. Regional groundwater flow direction is inferred to be northwest. Localized flow conditions across the site indicate a groundwater flow to the north to northwest in the unconfined clayey silt to silty clay aquifer.

- The shallow horizontal hydraulic gradient on-Site was an average of 0.1 m/m to 0.01 m/m to the north to northwest, depending on the time of year.

- For assessment purposes, EXP selected the MECP (2011) Table 1 SCS.

- Soil samples were submitted for the analysis of PHCs, BTEX, VOCs, PAHs, PCBs, OCPs, metals (including hydrides), and/or ORPs, (B-HWS, Cr (VI), Hg, CN, EC, SAR, pH). All soil parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of EC and PHCs, as follows:

    - Exceedances of PHC fraction F2 at BH4-SS3 (depth of 1.52 to 2.13 mbgs). A deeper sample from this location, BH4-SS7 (depth of 6.09 to 6.70 mbgs), was found to be within the Table 1 SCS for PHCs;

    - Exceedance of EC at BH5-SS1 (depth of 0.0 - 0.61 mbgs). A deeper sample from this location, BH5-SS7 (depth of 6.09 to 6.70 mbgs), was found to be within the Table 1 SCS for EC;

    - A pH (surficial) outside of the range of 5-9 was identified in samples BH5-SS1 (depth of 0.0 to 0.61 mbgs) and BH1-SS1 (depth of 0.0 to 0.61 mbgs). However, as the Table 1 SCS are applicable to the Site, these pH values are in line with the application of these standards.

- Based on the reported analytical results, an exceedance of EC was identified at the Site. It is the Qualified Person's (QP's) opinion that the elevated concentration of EC is associated with de-icing and salting substances routinely applied on-site during the winter months for vehicular and pedestrian safety. Therefore, as per Section 49.1 (1) of O. Reg. 153/04, which references Section 2 of Ontario Regulation 339 of the Revised Regulations of Ontario, 1990 (Classes of Contaminants – Exceptions), it is in the QP_{ESA}'s opinion that the elevated levels of EC are not exceedances of the applicable Table 1 SCS.

- A total of three (3) rounds of groundwater monitoring were completed. Monitoring occurred on October 2, 2024, November 21, 2024, and December 2, 2024 (round 1, round 2, round 3, respectively).

- Groundwater samples were submitted during the first round of groundwater monitoring for the analysis of PHCs, BTEX, VOCs, PAHs, metals (including hydrides) and ORPs (Cr (VI), Hg, CN, Na, Cl) from newly installed and accessible monitoring well BH4, and pre-existing monitoring wells BH1-23, BH2-23, BH5-23. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of ethylbenzene, PAHs (anthracene, chrysene, phenanthrene, pyrene), and metals (cobalt, nickel, selenium, and uranium), as follows:

    - Ethylbenzene and PAH (anthracene, chrysene, phenanthrene, pyrene) exceedances above the Table 1 SCS were identified in BH4 (having a screen depth of 0.91 to 3.96 mbgs);

    - Metals (cobalt, nickel, selenium, uranium) exceedances above the Table 1 SCS were identified in BH5-23 and its duplicate sample, BH5-23-0 (having a screen depth of 5.33 to 6.85 mbgs);

    - Uranium exceedance above the Table 1 SCS were identified in BH2-23 (having a screen depth of 4.42 to 7.47).

- Groundwater samples were submitted during the second round of groundwater monitoring for the analysis of PHCs, BTEX, VOCs, PAHs, metals (including hydrides) and ORPs (Cr (VI), Hg, CN, Na, Cl). Previously dry wells BH3 and BH7 were sampled during this event. Additionally, supplemental samples from BH4, BH2-23, and BH5-23 were obtained to assess the previously identified exceedances for PAHs, BTEX, and metals. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of metals (uranium and vanadium), as follows:

    - Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH2-23 (having a screen depth of 4.42 to 7.47), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).

  - A vanadium exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).

- Groundwater samples were submitted during the third round of groundwater monitoring for the analysis of PAHs, BTEX, and metals from BH3, BH4, BH7, BH2-23, and BH5-23. All groundwater parameters were either non-detect or detected below the applicable Table 1 SCS with the exception of metals (cobalt, uranium, and vanadium), as follows:

  - Uranium exceedances above the Table 1 SCS were identified in BH5-23 (having a screen depth of 5.33 to 6.85), BH3, BH7 and its duplicate BH7-0 (having screen depths of 4.57 to 7.62).

  - A vanadium and cobalt exceedance above the Table 1 SCS was identified in BH5-23 (having a screen depth of 5.33 to 6.85 mbgs).

- Given the two (2) consecutive clean rounds of groundwater sampling for nickel and selenium at BH5-23, these contaminants are not considered to be in exceedances of the Table 1 SCS at the Site.

- No evidence of free product (i.e. visible film or hydrocarbon sheen), or odour was observed during soil sampling, groundwater purging, or any of groundwater sampling events.

Soil in exceedance of the O. Reg. 153/04 Table 1 SCS for PHCs and groundwater in exceedance of the Table 1 SCS for metals (cobalt, uranium and vanadium) must be addressed prior to filing an RSC.

EXP is currently planning to re-sample the elevated pH values at the Site and remediate the soil PHC impacts at BH4 and historical location BH1-23. Further, a non-potable request application will be submitted to the Niagara Region, in order to apply Table 9 Standards to the Site. Pending favourable outcomes to these items and once subsequent reporting are completed, an RSC can be filed for the Site.

9 General Limitations

The information presented in this report is based on a limited investigation designed to provide information to support an assessment of the current environmental conditions within the subject property. The conclusions and recommendations presented in this report reflect Site conditions existing at the time of the investigation.

More specific information with respect to the conditions between samples, or the lateral and vertical extent of materials may become apparent during excavation operations. The interpretation of the borehole information must, therefore, be validated during any such excavation operations. Consequently, during the future development of the property, conditions not observed during this investigation may become apparent. Should this occur, EXP Services Inc. should be contacted to assess the situation, and the need for additional testing and reporting. EXP has qualified personnel to provide assistance in regards to any future geotechnical and environmental issues related to this property.

The environmental investigation was carried out to address the intent of applicable provincial Regulations, Guidelines, Policies, Standards, Protocols and Objectives administered by the Ministry of the Environment. It should also be noted that current environmental Regulations, Guidelines, Policies, Standards, Protocols and Objectives are subject to change, and such changes, when put into effect, could alter the conclusions and recommendations noted throughout this report. Achieving the study objectives stated in this report has required us to arrive at conclusions based upon the best information presently known to us. No investigative method can completely eliminate the possibility of obtaining partially imprecise or incomplete information; it can only reduce the possibility to an acceptable level. Professional judgment was exercised in gathering and analyzing information obtained and in the formulation of the conclusions. Like all professional persons rendering advice, we do not act as absolute insurers of the conclusions we reach, but we commit ourselves to care and competence in reaching those conclusions.

Our undertaking at EXP, therefore, is to perform our work within limits prescribed by our clients, with the usual thoroughness and competence of the engineering profession. It is intended that the outcome of this investigation assist in reducing the client's risk associated with environmental impairment. Our work should not be considered 'risk mitigation'. No other warranty or representation, either expressed or implied, is included or intended in this report.

This report was prepared for the exclusive use of by On The Lake Developments Inc. and may not be reproduced in whole or in part, without the prior written consent of EXP, or used or relied upon in whole or in part by other parties for any purposes whatsoever. Any use which a third party makes of this report, or any part thereof, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. EXP Services Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

10 Closure

We trust this report is satisfactory for your purposes. Should you have any questions, please do not hesitate to contact this office.

Yours truly,

EXP Services Inc.

Tables

Table 1: SITE ENVIRONMENTAL SETTING DATA

1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario
December 2024

NATIVE SOIL

Type:	silty clay to clayey silt till
Hydraulic Conductivity $> 10^{-3}$ cm/s:	
$<10^{-3}$ to $>10^{-6}$ cm/s:	1 x 10-7
$< 10^{-6}$ cm/s:	
Soil Texture:	Fine
Estimated or Measured:	Measured by geotechnical investigations

GROUND WATER

Depth to Water Table:	0.405 to 6.700 mbgs
Estimated or Measured:	Measured (EXP, 2024)
Direction of Flow:	North to Northwest
Estimated or Measured:	Measured (EXP, 2024)

MUNICIPAL SERVICES

Piped Water:	Yes
Ground Water Source:	Yes
Distance to Well:	N/A
Surface Water Source:	Lake Ontario
Sanitary Sewer:	Yes
Storm Sewer:	Yes

PRIVATE SERVICES

Distance to Nearest Well:	N/A
Approximate Depth of Well:	N/A
Private Sanitary Sewage:	N/A

SURFACE WATER

Name of water body:	Lower Virgil Reservoir
Distance from site:	5 m West
Elevation drop from site:	5 m
Direct Drainage from site:	No

Table 2: DARCY'S LAW CALCULATIONS

1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario
December 2024

Q=kia v=ki/n t=T/v

Permeability k (m/sec)* =	1.00E-09
(cm/sec) =	1.00E-07
Gradient i (m/m) =	0.010
Porosity** n =	0.2
Thickness T (m) =	NA

Velocity v (m/sec) =	5.00E-11
(feet/sec) =	1.64E-10
(feet/day) =	1.42E-05
(feet/year) =	5.17E-03
(metres/year) =	0.0016

Permeability for clayey silt calculated (EXP, 2023).
Effective porosity based on published values (McWhorter and Sunada, 1977).
Average gradient calculated (EXP, 2024).

TABLE 4A - Summary of Soil Samples Submitted for Chemical Analysis

1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario

December 2024

Soil Sample ID	Sample Depth Interval (m)	Rationale	Analysis
BH1-SS1	0.0 - 0.61	Assess fill of unknown quality	Metals, ORPs, PCBs
BH1-SS2	0.76 - 1.37	Assess fill of unknown quality	PHCs, VOCs, PAHs
BH1-SS7	6.09 - 6.70	Assess fill of unknown quality	pH
BH2-SS2	0.76 - 1.37	Assess former orchard/vineyard, horizontally delineate historical PHC exceedances at BH1-23	PHCs, Metals, ORPs, OCPs
BH2-SS3	1.52 - 2.13	Horizontally delineate historical PHC exceedances at BH1-23	PHCs, VOCs
BH2-SS7	6.09 - 6.70	Horizontally delineate historical PHC exceedances at BH1-23	PHCs, VOCs
BH3-SS1	0.0 - 0.61	Assess location of vent/fill pipes	Metals, ORPs
BH3-SS2	0.76 - 1.37	Assess former orchard/vineyard, location of vent/fill pipes	PAHs, OCPs
BH3-SS3	1.52 - 2.13	Assess location of vent/fill pipes	PHCs, VOCs
BH3-SS7	6.09 - 6.70	Assess location of vent/fill pipes	PHCs, VOCs
BH4-SS2	0.76 - 1.37	Assess former orchard/vineyard, former USTs, horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop	PAHs, Metals, ORPs, OCPs
BH4-SS3	1.52 - 2.13	Assess former USTs, horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop	PHCs, VOCs
BH4-SS7	6.09 - 6.70	Assess former USTs, horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop	PHCs, VOCs
BH5-SS1	0.0 - 0.61	Assess fill of unknown quality	Metals, ORPs
BH5-SS2	0.76 - 1.37	Assess fill of unknown quality	PHCs, VOCs, PAHs, PCBs
BH5-SS7	6.09 - 6.70	Assess fill of unknown quality	EC, pH
BH7-SS1	0.0 - 0.61	Assess repair shop	Metals, ORPs
BH7-SS2	0.76 - 1.37	Assess former orchard/vineyard and repair shop	PAHs, OCPs
BH7-SS3	1.52 - 2.13	Assess repair shop and horizontally delineate historical PHC exceedances at BH1-23	PHCs, VOCs
BH7-SS7	6.09 - 6.70	Assess repair shop and horizontally delineate historical PHC exceedances at BH1-23	PHCs, VOCs
QA/QC Samples:			
BH7-SS1-0	0.0 - 0.61	Duplicate of BH7-SS1	Metals, ORPs
BH7-SS2-0	0.76 - 1.37	Dup of BH7-SS2	PAHs, OCPs
BH7-SS3-0	1.52 - 2.13	Dup of BH7-SS3	PHCs, VOCs

ORPs - Other Regulated Parameters (B-HWS, Cr(VI), Hg, CN-, EC, SAR)

PCBs - Polychlorinated Biphenyls

OCPs - Organochlorine Pesticides

PAH - Polycyclic Aromatic Hydrocarbons

PHC - Petroleum Hydrocarbons

BTEX - Benzene, Toluene, Ethylbenzene and Xylenes

VOC - Volatile Organic Compounds

TABLE 4B - Summary of Groundwater Samples Submitted for Chemical Analysis
1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario
December 2024

GW Sample ID	Sampling Date	Rationale	Analysis
BH1-23	2-Oct-24	Investigation of former USTs	PHCs, VOCs, PAHs, Metals, ORPs
BH2-23	2-Oct-24	Investigation of marine and equipment repair shop	PHCs, VOCs, PAHs, Metals, ORPs
	21-Nov-24		Metals, ORPs
BH5-23	2-Oct-24	Investigation of marine and equipment repair shop	PHCs, VOCs, PAHs, Metals, ORPs
	21-Nov-24		Metals, ORPs
	2-Dec-24		Metals, ORPs
BH4	2-Oct-24	Investigation of former USTs	PHCs, VOCs, PAHs, Metals, ORPs
	21-Nov-24		PHCs, PAHs
	2-Dec-24		PHCs, PAHs
BH3	21-Nov-24	Investigation of location of former vent/fill pipes	PHCs, VOCs, PAHs, Metals, ORPs
	2-Dec-24		Metals, ORPs
BH7	21-Nov-24	Investigation of marine and equipment repair shop	PHCs, VOCs, PAHs, Metals, ORPs
	2-Dec-24		Metals, ORPs
QA/QC Samples:			
BH5-23-0	2-Oct-24	Duplicate of BH5-23	PHCs, VOCs, PAHs, Metals, ORPs
TRIP BLANK	2-Oct-24	QA/QC	VOCs
TRIP BLANK	21-Nov-24	QA/QC	VOCs
BH7-0	21-Nov-24	Duplicate of BH7	PHCs, VOCs, PAHs, Metals, ORPs
	2-Dec-24		Metals, ORPs
BH4-0	2-Dec-24	Duplicate of BH4	PHCs, PAHs

ORPs - Hot Water Soluble Boron, Cyanide, Mercury, Hexavalent Chromium, Electrical Conductivity and Sodium Adsorption Ratio
PAH - Polyaromatic Hydrocarbons
PHC - Petroleum Hydrocarbons
BTEX - Benzene, Toluene, Ethylbenzene and Xylenes
VOC - Volatile Organic Compound

Table 5A: MAXIMUM SOIL CONCENTRATION DATA - Petroleum Hydrocarbons

Appendix A – Limitations and Use of Report

LIMITATIONS AND USE OF REPORT

BASIS OF REPORT

The Report is based on site conditions known or inferred by the investigation undertaken as of the date of the Report. Should changes occur which potentially impact the condition of the site the recommendations of EXP may require re-evaluation. Where special concerns exist, or the Client has special considerations or requirements, these should be disclosed to EXP to allow for additional or special investigations to be undertaken not otherwise within the scope of investigation conducted for the purpose of the Report.

Where applicable, recommended field services are the minimum necessary to ascertain that construction is being carried out in general conformity with building code guidelines, generally accepted practices and EXP's recommendations. Any reduction in the level of services recommended will result in EXP providing qualified opinions regarding the adequacy of the work. EXP can assist design professionals or contractors retained by the Client to review applicable plans, drawings, and specifications as they relate to the Report or to conduct field reviews during construction.

RELIANCE ON INFORMATION PROVIDED

The evaluation and conclusions contained in the Report are based on conditions in evidence at the time of site inspections and information provided to EXP by the Client and others. The Report has been prepared for the specific site, development, building, design or building assessment objectives and purpose as communicated by the Client. EXP has relied in good faith upon such representations, information and instructions and accepts no responsibility for any deficiency, misstatement or inaccuracy contained in the Report as a result of any misstatements, omissions, misrepresentation or fraudulent acts of persons providing information. Unless specifically stated otherwise, the applicability and reliability of the findings, recommendations, suggestions or opinions expressed in the Report are only valid to the extent that there has been no material alteration to or variation from any of the information provided to EXP.

STANDARD OF CARE

This report ("Report") has been prepared in a manner consistent with the degree of care and skill exercised by engineering consultants currently practicing under similar circumstances and locale. No other warranty, expressed or implied, is made. Unless specifically stated otherwise, the Report does not contain environmental consulting advice.

COMPLETE REPORT

All documents, records, data and files, whether electronic or otherwise, generated as part of this assignment form part of the Report. This material includes, but is not limited to, the terms of reference given to EXP by the Client, communications between EXP and the Client, other reports, proposals or documents prepared by EXP for the Client in connection with the site described in the Report. In order to properly understand the suggestions, recommendations and opinions expressed in the Report, reference must be made to the Report in its entirety. EXP is not responsible for use by any party of portions of the Report.

USE OF REPORT

The information and opinions expressed in the Report, or any document forming part of the Report, are for the sole benefit of the Client. No other party may use or rely upon the Report in whole or in part without the written consent of EXP. Any use of the Report, or any portion of the Report, by a third party are the sole responsibility of such third party. EXP is not responsible for damages suffered by any third party resulting from unauthorised use of the Report.

REPORT FORMAT

Where EXP has submitted both electronic file and a hard copy of the Report, or any document forming part of the Report, only the signed and sealed hard copy shall be the original documents for record and working purposes. In the event of a dispute or discrepancy, the hard copy shall govern. Electronic files transmitted by EXP utilize specific software and hardware systems. EXP makes no representation about the compatibility of these files with the Client's current or future software and hardware systems. Regardless of format, the documents described herein are EXP's instruments of professional service and shall not be altered without the written consent of EXP.

Appendix C – Qualification of Assessors

Qualifications of Assessors

Amanda Catenaro, M.E.Sc., P.Geo., QPESA (Senior Project Manager)

Amanda Catenaro graduated from McMaster University in 2012 with a Bachelor of Science degree in Environmental Science, specialized in Hydrogeology and Climatology. She completed her Master of Environmental Science Degree from the University of Toronto in 2013. Ms. Catenaro has worked on a number of Phase One and Two environmental site assessments, delineation programs, ex-situ and in-situ remediation projects, and peer reviews since joining EXP Services Inc. in 2013. She is currently completing the required studies for several City's contracts for 2023 and 2024 Capital Years in accordance with the Planning Requirements of O. Reg. 406/19.

Ms. Catenaro has international experience working on environmental projects in the United Kingdom and United States of America, including undertaking desk studies, risk assessments, and remediation projects (strategy development, design, implementation and validation). She has closed-out projects in a variety of specialized sectors such as transportation, highway, rail, and water schemes.

Ms. Catenaro is a Professional Geologist (P.Geo.) in Ontario and is a Qualified Person (QP) for environmental site assessments under Ontario Regulation 153/04.

Kate Miles, P.Eng. (Senior Environmental Scientist)

Kate Miles graduated from Queen's University with a Bachelor of Science in Chemical Engineering in 2010, and from Ryerson University's Chang School of Continuing Education with a certificate in Environmental Engineering Science in 2014. She has over nine years of experience in environmental consulting. She is a licensed professional engineer in Ontario.

Jaimesyn Patterson (Environmental Scientist)

Jaimesyn Patterson graduated from Queen's University with an Honours Degree in Biology. Since joining EXP in March 2024, her fieldwork experiences have included overseeing the drilling of boreholes and installation of monitoring wells, groundwater network monitoring, conducting Phase One and Phase Two Environmental Site Assessments (in accordance with the applicable CSA Standards and O.Reg. 153/04), and aiding in project reporting efforts.

EXP Services Inc. is a full-service consulting and engineering firm and provides a full range of environmental services through the Environmental Services Group. EXP's Environmental Services Group has developed a strong working relationship with clients in both the private and public sectors and has developed a positive relationship with the Ontario Ministry of the Environment. Personnel in the numerous branch offices form part of a large network of full-time dedicated environmental professionals in the EXP organization.

Appendix D – Sampling and Analysis Plan

Memorandum

Date: September 23, 2024

To:

From: Amanda Catenaro

CC:

RE: Environmental Phase Two ESA
1544 & 1546 Four Mile Creek Rd, Niagara-on-the-Lake, Ontario

Project Number:	**GTR-24000672-C0-2**
Date(s) of Field Work:	**Drilling – September 24, 2024**
Site Address:	**1544 & 1546 Four Mile Creek Rd, Niagara-on-the-Lake, Ontario**
PM Contact:	**Amanda Catenaro, (647) 937-7008**
Laboratory:	**AGAT, Travis Judd, 905-712-5130**

PROJECT OBJECTIVES:

The purpose of this Supplemental drilling investigation is to:

- Investigate areas of potential environmental concern (APECs) identified by the ongoing Phase One investigation.
- Complete soil and groundwater sampling for petroleum hydrocarbons (PHCs), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), and metals and inorganics at three (3) of the boreholes being advanced as part of the combined geotechnical/hydrogeological/environmental investigations

EXP Services Inc. (EXP) will carry out a soil and groundwater sampling program at the site. The drilling company has been retained for the drilling work, including the advancement of a total of eight (8) boreholes, only three (3) of which will be used for environmental purposes.

Groundwater monitors will be installed at three (3) of the boreholes (BH2, BH3, BH4).

Soil Sampling

- All environmental sampling on this site should be completed as indicated in Table 1.

- Soil samples will be collected from clean split spoon samplers or lined dual tube samplers. The soil samples will be inspected for visual and olfactory evidence of chemical impact and for geological composition. The findings will be recorded in a log. Vapour readings in the soil will be measured using an RKI Eagle 2 portable hydrocarbon surveyor or equivalent.

…/2

- Soil samples will be collected as set out in Table 1. For soil samples placed in methanol vials, please ensure that they are accompanied by a jar of soil for **moisture content** analysis, if they are not accompanied by a jar for another parameter (i.e. PHCs).

Table 1: Soil Sampling Summary

Borehole ID	Approximate Depth of Soil Sample*	Sampling Rationale	Parameters	Well install
BH1	**Metals and Inorganics/PAHs/PCBs** - worse case (0-1.5m) Submit deeper delineation sample from about 4-5m on HOLD	Assess fill of unknown quality	PHCs, VOCs, PAHs, PCBs, Metals and Inorganics	**No well installation**
	PHCs/VOCs –0 -1.5m Submit deeper delineation sample from about 4-5m on HOLD			
BH2	**Metals and Inorganics/PAHs/OC pesticides** - worse case (0-1.5m) Submit deeper delineation sample from about 3-4m on HOLD	Assess former orchard/vineyard, horizontally delineate historical PHC exceedances at BH1-23	PHCs, PAHs, VOCs, OC Pesticides, Metals and Inorganics	**No well installation**
	PHCs/VOCs – 1.5-2.0 m **PHCs/VOCs** – worst case or at water table (expected at 6m)	horizontally delineate historical PHC exceedances at BH1-23		
BH3	**Metals and Inorganics/PAHs/OC pesticides** - worse case (0-1.5m) Submit deeper delineation sample from about 3-4m on HOLD	Assess former orchard/vineyard, location of vent/fill pipes	PHCs, PAHs, VOCs, OC Pesticides, Metals and Inorganics	Install well for groundwater (estimated screen 5 to 8 mbgs or 2m below observed water table)
	PHCs/VOCs – 1.5-2.0 m **PHCs/VOCs** – worst case or at water table (expected at 6m) Submit deeper delineation sample	Assess location of vent/fill pipes		

Borehole ID	Approximate Depth of Soil Sample*	Sampling Rationale	Parameters	Well install
	from about 8m or deeper on HOLD			
BH4	**Metals and Inorganics/PAHs/OC pesticides** - worse case (0-1.5m)	Assess former orchard/vineyard, former USTs, horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop	PHCs, PAHs, VOCs, OC Pesticides, Metals and Inorganics	Install well for groundwater (estimated screen 5 to 8 mbgs or 2m below observed water table)
	PHCs/VOCs – 1.5-2.0m **PHCs/VOCs** – worst case or at water table (expected at 6m) Submit deeper delineation sample from about 8m or deeper on HOLD			
BH5	**Metals and Inorganics/PAHs/PCBs** - worse case (0-1.5m) Submit deeper delineation sample from about 4-5m on HOLD	Assess fill of unknown quality	PHCs, VOCs, PAHs, PCBs, Metals and Inorganics	**No well installation**
	PHCs/VOCs –0 -1.5m Submit deeper delineation sample from about 4-5m on HOLD			
BH7	**Metals and Inorganics/PAHs/OC pesticides** - worse case (0-1.5m)	Assess former orchard/vineyard, repair shop, horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop	PHCs, PAHs, VOCs, OC Pesticides, Metals and Inorganics	Install well for groundwater (estimated screen 5 to 8 mbgs or 2m below observed water table)
	PHCs/VOCs – 1.5-2.0m **PHCs/VOCs** – worst case or at water table (expected at 6m) Submit deeper delineation sample from about 8m or deeper on HOLD	horizontally delineate historical PHC exceedances at BH1-23, assess marine and equipment repair shop		

*Guidance on sampling depths:

- Collect one (1) field duplicate soil sample per ten (10) samples for each parameter, to be submitted to the laboratory for quality assurance/quality control (QA/QC) purposes.

- Monitors will be constructed as 2'' monitors with a PVC screen interval no longer than 3.1 metres (10 feet) as specified by O. Reg. 153/04, and capped at the base of the monitor. The monitor will be backfilled with sand to an elevation of 0.3 to 0.6 metres (1 to 2 feet) above the top of the screened interval. The monitor will be sealed with bentonite to surface, capped with a locked j-plug and finished with a flush mount casing set in concrete. Please record monitor installation details including riser pipe length, screen interval slot size (e.g. 0.01-inch slot size, 2 TPI), diameter of annulus and depth to top of sand pack.

- Develop the newly installed groundwater monitoring wells as they are installed, to ensure that they can be sampled concurrent with the drilling program.

- Soil cuttings will be segregated on-site for future disposal, if required. In the event that the need to identify soil cuttings is identified, please contact the PM prior to proceeding.

- Sample pick-ups will be organized for the site on as as-needed basis, based on the progress of drilling. Please discuss with the PM to ensure that sample pick-ups are scheduled as required.

- Soil samples should be submitted on regular turn-around time. Please ensure soil samples are properly preserved with ice in a storage cooler maintained below 10ºC

Groundwater Sampling

- Groundwater samples will be collected from the 3 newly installed monitor (BH3, BH4 and BH7) and 3 pre-existing wells (BH1-23, BH2-23 and BH5-23). Monitoring wells will be properly developed by purging to representative aquifer conditions. 6 groundwater Samples will be retrieved from the newly installed monitoring wells and pre-existing wells using low flow techniques, with either a peristaltic pump or bladder pump. Use proper sampling techniques to avoid introducing contaminants into the groundwater sample. Use proper decontamination techniques between monitors.

- If no obvious impacts are noted, purged water can be disposed onto a paved area of the site away from any catch basins.

- Groundwater samples will be collected from the groundwater monitoring wells using new clean tubing. Collected groundwater samples will be submitted to AGAT for analysis of PHCs, VOCs, Metals and Inorganics, and PAHs.

- Collect one (1) field duplicate groundwater sample per ten (10) samples for each parameter, to be submitted to the laboratory for QA/QC purposes. **A trip blank should be submitted with each submission of groundwater samples to the laboratory and analyzed for F1/VOCs.**

- Please communicate with the PM to arrange the sample pickup details for the groundwater samples. Groundwater samples should be submitted on a **regular** turn-around time. Please ensure samples are properly preserved with ice in a storage cooler maintained below 10ºC.

Table 2: Groundwater Sampling Summary

Monitor ID	Screen Interval (mbgs)	Purpose	Parameters
BH3	4.57 - 7.62	Investigation of former orchard/vineyard.	PHCs, VOCs, Metals and Inorganics, PAHs
BH4	0.91 - 3.96	Investigation of former USTs.	PHCs, VOCs, Metals and Inorganics, PAHs
BH7	4.57 - 7.62	Investigation of marine and equipment repair shop.	PHCs, VOCs, Metals and Inorganics, PAHs
BH1-23	2.14 - 5.18	Investigation of former USTs.	PHCs, VOCs, Metals and Inorganics, PAHs
BH2-23	4.43 - 7.47	Investigation of marine and equipment repair shop.	PHCs, VOCs, Metals and Inorganics, PAHs
BH5-23	3.67-6.71	Investigation of marine and equipment repair shop.	PHCs, VOCs, Metals and Inorganics, PAHs

Notes:

*These are estimates only, actual depth will depend on drilling. Well to be installed about 2m below observed water table.

Chain of Custody Information

- Project number GTR-24000672-C0-2 for soil and groundwater samples, Table 1 RPI medium/fine Standards.
- Soil analyses: PHC fractions F1 to F4, VOCs, PAHs, metals and inorganics, OC pesticides, PCBs
- Soil QA/QC: field duplicate samples (Remember to have at least one (1) per ten (10) samples for each parameter group)
- Groundwater Analyses: PHC fractions F1 to F4, VOCs, PAHs, metals and inorganics
- Groundwater QA/QC: field duplicate samples (Remember to have at least one (1) field duplicate sample per ten (10) samples for each parameter group), F1/VOC trip blank with each submission

Appendix F – Quality Assurance and Quality Control Measures

Quality Management, Control and Assurance

Project Quality Management

Sample collection was performed using generally accepted principles and with appropriate sampling equipment. Written field sampling procedures for soil and groundwater developed by EXP were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory. The Ministry of Environment, Conservation and Parks (MECP) document entitled *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario*, December 1996, was used as a reference.

The staff involved in the field sampling have participated in regular, ongoing EXP training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties* under Part XV.1 of the Environmental Protection Act (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable Reporting Detection Limits (RDLs) to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic Standards, as defined in Ontario Regulation (O. Reg.) 153/04, as amended to date, under the Environmental Protection Act. This included providing written instruction to the participating analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples.

Field Quality Assurance/Quality Control

The Sampling and Analysis Plan was prepared and executed based on the findings of the Phase One ESA Update (EXP, dated October 7, 2024), the needs of the client during future site redevelopment activities, and on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by EXP.

EXP field sampling Quality Assurance/ Quality Control (QA/QC) protocols are tailored to the investigation and include, where appropriate:

- the collection of at least one duplicate sample per site for both soil and groundwater (where three or more such samples are collected);
- where volatile organic chemical analysis of groundwater is required, one trip blank shall be submitted for laboratory analysis with each submission;
- where volatile organic chemical analysis is required, the collection of discrete samples directly into sample bottles with teflon-lined lids and immediate placement into a cooler with free ice to maintain the temperature at less than 10^{o} C for transport to the laboratory;
- the use of dedicated equipment for groundwater sampling at different monitors and the thorough cleaning of soil sampling equipment between sample sites; and,

- where sampling for trace organics (organic chemicals with a criterion value of less than 1 µg/g and/or samples collected for determination of background trace organic concentrations), ensuring that neither the bare hand or latex glove comes into contact with the soil or water as it is being placed into the laboratory sample container; soil sampling equipment used for the collection of trace organics is cleaned using soap & water, followed by a water rinse and a methanol rinse between sampling sites.

The results of the duplicate samples are presented along with the tabulated data in the report. Tabulated data are presented to a maximum of three significant digits where reported by the laboratory.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by AGAT Laboratories (AGAT), accredited laboratories for these tests. AGAT performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

EXP has accepted the data provided by AGAT based on the assurance from AGAT that as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- the method performance criteria identified in the Protocol were met;
- sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met;
- the results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided;
- surrogate recoveries (for organic analyses) were monitored and recorded;
- details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of an MECP audit;
- the analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis);
- all soil sampling results were reported on a dry weight basis; and,
- a Certificate of Analysis with all QA/QC sample data, including surrogate recoveries, has been received from the laboratory and is appended.

Four (4) soil sample/field duplicate sample pair(s) were collected and analyzed for the following pCOCs:

- BH7-SS3/BH7-SS30 for PHCs/BTEX and VOCs;
- BH7-SS2/BH7-SS20 for PAHs and OCPs;
- BH7-SS1/BH7-SS10 for Metals and ORPs;
- BH1-SS1/BH1-SS1-0 for PCBs.

Four (4) groundwater sample/field duplicate sample pairs were collected and analyzed for the following pCOCs:

- BH5-23/BH5-23-0 for PHCs/BTEX, VOCs, PAHs, Metals and ORPs.
- BH7/BH7-0 for PHCs/BTEX, VOCs, PAHs, Metals and ORPs;
- BH7/BH7-0 for Metal and ORPs;
- BH4/BH4-0 for PAHs and PHCs/BTEX

A VOC trip blank was also transported to the site and submitted to the laboratory with the groundwater samples. A total of two (2) trip blank was analyzed for VOCs during the Phase Two ESA.

The relative percent differences (RPDs) of the soil and groundwater field duplicate samples are provided in this appendix. It should be noted that meaningful RPDs cannot be calculated if the analytical results are less than 5 times the reporting detection limits (RDLs) or if the average of the two sample concentrations are less than 5 times the RDL.

For soil samples, the alert limit criteria for the field duplicate RPD is >10% for EC, >30% for PHCs, OCPs, PCBs, metals (including hydride forming metals) and ORPs (Hg and SAR), >35% for ORPs (Cr (VI) and CN-), >40% for PAHs, ORPs (B-HWS), and >50% for VOCs. The calculated RPD between the duplicate samples and the original samples for soil was below the applicable alert limit criteria for all of the parameters analyzed, with the following exceptions:

- The RPD was 33% for arsenic, 40% for copper, 33% for lead, 45% for molybdenum, 45% for zinc, and 15% for electrical conductivity (EC) between sample BH7-SS1 and duplicate BH7-SS10.

Even though the calculated RPDs for metals and EC between sample BH7-SS1 and duplicate BH7-SS10 were above the alert limit criteria of 30% and 10%, respectively, this does not affect the conclusions of the Phase Two ESA as both concentrations of the samples and duplicates of the above-mentioned parameters were within the MECP (2011) Table 1 Background Site Condition Standards (SCS) for Residential/Parkland/Institutional/Commerical/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the "Table 1 SCS"). The RPD exceedances in soil are attributed to the surficial nature of the sample (SS1) leading to soil heterogeneity; the sample was observed to contain mostly granular material and asphalt.

For groundwater samples, the alert limit criteria for the field duplicate RPD is >30% for PHCs/BTEX, VOCs, and PAHs, and >20% for metals (including hydride-forming metals) and ORPs (Hg, Cr (VI), CN-, Na and Cl). The calculated RPD between the duplicate samples and the original samples for groundwater was below the applicable alert limit criteria for all of the parameters analyzed with the following exceptions:

- The RPD was 56% for molybdenum and 49% for selenium between sample BH5-23 and duplicate BH5-23-0;
- The RPD was 27% for copper, 54% for nickel and 37% for vanadium between sample BH7 and duplicate BH7-0;
- The RPD was 49% for molybdenum and 67% for vanadium between sample BH7 and duplicate BH7-0;

Even though the calculated RPD for metals between samples BH5-23 and its duplicate BH5-23-0, BH7 and its duplicate BH7-0, and BH7 and its duplicate BH7-0, were above the alert limit criteria of 20% this does not affect the conclusions of the Phase Two ESA, as concentrations of above-mentioned parameters were within the O. Reg. 153/04 Table 1 SCS with the exception of the concentration of selenium in sample BH5-23. However, BH5-23 was re-sampled during round 2 and round 3 of groundwater monitoring and was found to be within the Table 1 SCS both times. As such, it was removed as a COC. Therefore, the conclusions are not affected, and objectives of the Phase Two ESA are considered to have been met.

The trip blanks were below the laboratory RDL for all VOCs analyzed. No laboratory data quality issues were identified that would have a material effect on the interpretation of results presented in this report.

The overall assessment indicates that the soil and groundwater samples were collected with an acceptable level of precision, and the data is acceptable quality for meeting the objectives of the Phase Two ESA.

The subcontract laboratory used during this investigation, AGAT, is accredited by the Standards Council of Canada/Canadian Association of Environmental Analytical Laboratories in accordance with ISO/IEC 17025:1999 – "General Requirements for the Competence of Testing and Calibration Laboratories" for the analysis of all parameters for all samples in the scope of work for which SCS have been established under Ontario Regulation 153/04.

The analytical programs conducted by AGAT included analytical test group specific QA/QC measures to evaluate the accuracy and precision of the analytical results and the efficiency of analyte recovery during solute extraction procedures. The laboratory QA/QC program consisted of the preparation and analysis of laboratory duplicate samples to assess precision and sample homogeneity, method blanks to assess analytical bias, spiked blanks and QC standards to evaluate analyte recovery, matrix spikes to evaluate matrix interferences and surrogate compound recoveries (VOCs only) to evaluate extraction efficiency. The laboratory QA/QC results are presented in the Quality Assurance Report provided in the Certificate of Analysis prepared by AGAT. The QA/QC results are reported as percent recoveries for matrix spikes, spike blanks and QC standards, relative percent difference for laboratory duplicates and analyte concentrations for method blanks. The QA/QC results were assessed against test group control limits in the case of spiked blanks, matrix spikes and surrogate recoveries and alert criteria in the case of method blanks and laboratory duplicates. Review of the laboratory QA/QC results reported by AGAT indicated that they were within acceptable control limits or below applicable alert criteria for the sampled media and analytical test groups with the following exception;

- A molybdenum groundwater QA/QC lab exceedance was identified in the Lab CofA 24H204750. A method blank spike recovery was measured at 124% where the upper acceptable limit was 120%. Given that this indicates that our samples would be biased high for molybdenum and because our samples were all still within the MECP Table 1 Standards for molybdenum, for groundwater, this is not considered to affect the conclusions of the Phase Two ESA.

Based on the assessment of the QA/QC, the analytical results reported are of acceptable quality and data qualifications are not required.

1&2-Methylnaphthalene	0.05	<0.05	<0.05	nc	>40%

NOTES:

Analysis by AGAT.

All results in ppm (µg/g) and based on dry weight basis.

* Minimum Analytical Reporting Detection Limit (MDL) is listed. Refer to individual Certificate of Analyses for sample-specific Reporting Detection Limit (RDL) value.

**Depth below basement floor

'nc' means "not calculable", since one (or both) of the results are less than the RDL or the average of the two sample concentrations are less than 5 times the MDL.

Exceedences of alert limits are shown in **bold**.

1&2-Methylnaphthalene	0.2	<0.20	<0.20	nc	>30%

NOTES:

Analysis by AGAT.

All results in ppb (µg/L).

* Minimum Analytical Reporting Detection Limit (MDL) is listed. Refer to individual Certificate of Analyses for sample-specific Reporting Detection Limit (RDL) value.

'nc' means "not calculable", since one (or both) of the results are less than the RDL or the average of the two sample concentrations are less than 5 times the MDL.

Exceedences of alert limits are shown in **bold**.

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

DATE RECEIVED: 2024-09-26 **DATE REPORTED: 2024-10-03**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6177134-6177151 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6177134-6177166 Results are based on the dry weight of the soil.
DDT total is a calculated parameter. The calculated value is the sum of op'DDT and pp'DDT.
DDD total is a calculated parameter. The calculated value is the sum of op'DDD and pp'DDD.
DDE total is a calculated parameter. The calculated value is the sum of op'DDE and pp'DDE.
Endosulfan total is a calculated parameter. The calculated value is the sum of Endosulfan I and Endosulfan II.
Chlordane total is a calculated parameter. The calculated value is the sum of Alpha-Chlordane and Gamma-Chlordane.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Terphenyl-d14	%	50-140		105	105	100	110

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6177134-6177166 Results are based on the dry weight of the soil.
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6177137-6177170 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified without the contribution of PAHs. Under Ontario Regulation 153, results are considered valid without determining the PAH contribution if not requested by the client.

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

O. Reg. 153(511) - Metals & Inorganics (Soil)

DATE RECEIVED: 2024-09-27 **DATE REPORTED: 2024-10-03**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182808-6182818 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Surrogate	**Unit**	**Acceptable Limits**			
Naphthalene-d8	%	50-140		70	85
Acridine-d9	%	50-140		95	75
Terphenyl-d14	%	50-140		80	105

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182810-6182821 Results are based on the dry weight of the soil.
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene.

F4 (C34 to C50)	µg/g	120	50	<50
Gravimetric Heavy Hydrocarbons	µg/g	120	50	NA
Moisture Content	%		0.1	11.3
Surrogate	**Unit**	**Acceptable Limits**		
Toluene-d8	%	50-140		100
Terphenyl	%	60-140		81

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182810 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

4-Bromofluorobenzene	% Recovery	50-140		88	88

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182810-6182819 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

O. Reg. 153(511) - Metals & Inorganics (Soil)

DATE RECEIVED: 2024-09-27 **DATE REPORTED: 2024-10-03**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182498 EC was determined on the DI water extract obtained from the 2:1 leaching procedure (2 parts DI water:1 part soil). pH was determined on the 0.01M CaCl2 extract prepared at 2:1 ratio. SAR is a calculated parameter.

Terphenyl	%	60-140		70	72

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182502-6182511 Results are based on sample dry weight.
The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX contribution.
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC6 and nC10 response factors are within 30% of Toluene response factor.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.
Fractions 1-4 are quantified without the contribution of PAHs. Under Ontario Regulation 153, results are considered valid without determining the PAH contribution if not requested by the client.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Soil - Residential/Parkland/Institutional/Industrial/Commercial/Community Property Use
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6182502-6182511 The sample was analyzed using the high level technique. The sample was extracted using methanol, a small amount of the methanol extract was diluted in water and the purge & trap GC/MS analysis was performed. Results are based on the dry weight of the soil.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene.
1,3-Dichloropropene total is a calculated parameter. The calculated value is the sum of Cis-1,3-Dichloropropene and Trans-1,3-Dichloropropene.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

Terphenyl-d14	%	50-140		96	93	90	86	76

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6194080-6194131 Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amount
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&(j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

Analysis performed at AGAT Toronto (unless marked by *)

Terphenyl	% Recovery	60-140			85	79	85	75	72

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6194080-6194131 The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

O. Reg. 153(511) - Metals & Inorganics (Water)

DATE RECEIVED: 2024-10-02

DATE REPORTED: 2024-10-10

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6194080-6194131 Metals analysis completed on a filtered sample.
pH is a recommended field analysis taken within 15 minutes of sample collection. Due to the potential for rapid change in sample equilibrium chemistry laboratory results may differ from field measured results
Dilution required, RDL has been increased accordingly.

Analysis performed at AGAT Toronto (unless marked by *)

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

m & p-Xylene	µg/L		0.20	<0.20
o-Xylene	µg/L		0.10	<0.10
Xylenes (Total)	µg/L	72	0.20	<0.20
Surrogate	**Unit**	**Acceptable Limits**		
Toluene-d8	% Recovery	50-140		113
4-Bromofluorobenzene	% Recovery	50-140		100

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6348782 Results relate only to the items tested.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene + o-Xylene. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6348736-6348779 The C6-C10 fraction is calculated using toluene response factor.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amounts

Method Summary

CLIENT NAME: EXP SERVICES INC

AGAT WORK ORDER: 24H224127

PROJECT: GTR-24000672-C0-4

ATTENTION TO: Amanda Catenaro

SAMPLING SITE:1544 & 1546 Far mile Creek Rd,

SAMPLED BY:JP

PARAMETER	AGAT S.O.P	LITERATURE REFERENCE	ANALYTICAL TECHNIQUE
Water Analysis			
Dissolved Antimony	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Arsenic	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Barium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Beryllium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Boron	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Cadmium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Chromium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Cobalt	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Copper	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Lead	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Molybdenum	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Nickel	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Selenium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Silver	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Thallium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Uranium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Vanadium	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Dissolved Zinc	MET-93-6103	modified from EPA 200.8 and EPA 3005A	ICP-MS
Mercury	MET-93-6100	modified from EPA 245.2 and SM 3112 B	CVAAS
Chromium VI	INOR-93-6073	modified from SM 3500-CR B	LACHAT FIA

Notes

Disclaimer:

- *All work conducted herein has been done using accepted standard protocols, and generally accepted practices and methods. AGAT test methods may incorporate modifications from the specified reference methods to improve performance.*
- *All samples will be disposed of within 30 days after receipt unless a Long Term Storage Agreement is signed and returned. Some specialty analysis may be exempt, please contact your Client Project Manager for details.*
- *AGAT's liability in connection with any delay, performance or non-performance of these services is only to the Client and does not extend to any other third party. Unless expressly agreed otherwise in writing, AGAT's liability is limited to the actual cost of the specific analysis or analyses included in the services.*
- *This Certificate shall not be reproduced except in full, without the written approval of the laboratory.*
- *The test results reported herewith relate only to the samples as received by the laboratory.*
- *Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to, warranties of merchantability, fitness for a particular purpose, or non-infringement. AGAT assumes no responsibility for any errors or omissions in the guidelines contained in this document.*
- *All reportable information is available on request from AGAT Laboratories, in accordance with ISO/IEC 17025:2017, ISO/IEC 17025:2005 (Quebec), DR-12-PALA and/or NELAP Standards.*
- *This document is signed by an authorized signatory who meets the requirements of the MELCCFP, CALA, CCN and NELAP.*
- *For environmental samples in the Province of Quebec: The analysis is performed on and results apply to samples as received. A temperature above 6°C upon receipt, as indicated in the Sample Reception Notification (SRN), could indicate the integrity of the samples has been compromised if the delay between sampling and submission to the laboratory could not be minimized.*

2-and 1-methyl Napthalene	µg/L	2	0.20	<0.20	<0.20
Sediment				1	1
Surrogate	**Unit**	**Acceptable Limits**			
Naphthalene-d8	%	50-140		110	122
Acridine-d9	%	50-140		106	110
Terphenyl-d14	%	50-140		110	114

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6376784-6376832 Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amount
Note: The result for Benzo(b)Fluoranthene is the total of the Benzo(b)&(j)Fluoranthene isomers because the isomers co-elute on the GC column.
2- and 1-Methyl Naphthalene is a calculated parameter. The calculated value is the sum of 2-Methyl Naphthalene and 1-Methyl Naphthalene. The calculated parameter is non-accredited. The parameters that are components of the calculation are accredited.

SAMPLED BY:JP

O. Reg. 153(511) - PHCs F1 - F4 (with PAHs) (Water)

DATE RECEIVED: 2024-12-03 **DATE REPORTED: 2024-12-10**

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: Refers to Table 1: Full Depth Background Site Condition Standards - Ground Water - All Types of Property Uses
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

6376784-6376832 Sediment parameter is comment only based on visual inspection of the sample prior to extraction and is not an accredited test.
Legend: 1 = no sediment present; 2 = sediment present; 3 = sediment present in trace amount
The C6-C10 fraction is calculated using toluene response factor.
Xylenes total is a calculated parameter. The calculated value is the sum of m&p-Xylene and o-Xylene.
C6–C10 (F1 minus BTEX) is a calculated parameter. The calculated value is F1 minus BTEX.
The calculated parameters are non-accredited. The parameters that are components of the calculation are accredited.
The C10 - C16, C16 - C34, and C34 - C50 fractions are calculated using the average response factor for n-C10, n-C16, and n-C34.
Gravimetric Heavy Hydrocarbons are not included in the Total C16-C50 and are only determined if the chromatogram of the C34 - C50 hydrocarbons indicates that hydrocarbons >C50 are present.
The chromatogram has returned to baseline by the retention time of nC50.
Total C6 - C50 results are corrected for BTEX and PAH contributions.
C>10 – C16 (F2- Naphthalene) is a calculated parameter. The calculated value is F2 - Naphthalene.
C>16 - C34 (F3-PAH) is a calculated parameter. The calculated value is F3-PAH (PAH: sum of Phenanthrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-c,d)pyrene and Pyrene).
This method complies with the Reference Method for the CWS PHC and is validated for use in the laboratory.
nC10, nC16 and nC34 response factors are within 10% of their average.
C50 response factor is within 70% of nC10 + nC16 + nC34 average.
Linearity is within 15%.
Extraction and holding times were met for this sample.

1. Phase Two Conceptual Site Model

This section presents a Phase Two Conceptual Site Model (P2CSM) providing a narrative, graphical and tabulated description integrating information related to the Site geologic and hydrogeologic conditions, areas of potential environmental concern/potential contaminating activities, the presence and distribution of potential contaminants of concern, contaminant fate and transport, and potential exposure pathways. These components are discussed in the following sections. The Phase Two CSM was completed in accordance with Ontario Regulation (O. Reg.) 153/04 as defined by the Ministry of the Environment, Conservation, and Parks (MECP).

All analytical results were compared to the MECP (2011) Table 1: Full Depth Background SCS for Residential/Parkland/Institutional/Commercial/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the "Table 1 SCS").

All investigative work at the Site was compiled into the current P2CSM.

1.1 Introduction

The Site is approximately 1.08 hectares (2.66 acres) in size and is currently occupied by a split-level residential home and a detached, formerly commercial garage. The Site was first developed for mixed commercial and residential use in the 1960s and historically has been used as a garage for construction and maintenance of marine vehicles. Two underground storage tanks (USTs) are associated with the Site; one (1) historical UST located at the exterior of the garage, and one (1) present UST currently located at the north end of the residential building. The Phase One Study Area consists of properties within a distance of approximately 250 metres from the Site boundaries. The Phase One Study Area and Surrounding Land Use are shown on Figure 2.

The Site identification information is presented in Table 1.

Table 1: Site Identification Information

Municipal Address(es)	1544 & 1546 Four Mile Creek Road, Niagara-on-the-Lake, Ontario
Current Land Use	Residential/Commercial
Proposed Land Use	Residential/Commercial
Legal Description	PT TWP LT 112 NIAGARA; PT RDAL BTN TWP LT 111 & 112 NIAGARA PT 1 30R668 & AS IN RO119545 EXCEPT PT 4 SPPL85; PT 2 30R668, RO164363, BLOCK 46831 S/T INTEREST OF THE MUNICIPALITY; NIAGARA-ON-THE-LAKE PT TWP LT 112 NIAGARA AS IN RO7678 EXCEPT HWY637; NIAGARA-ON-THE-LAKE
Property Identification Number (PIN)	46383-0086 (LT) 46383-0087 (LT)

Accuracy Estimate of UTM	10-15 m
Measurement Method	GPS
Site Area	1.07 hectares (2.66 acres)
Property Owner **Owner Contact** **Address**	Esfandiar Aghaei and On The Lake Developments Inc. Stephen Aghaei 3985 Highway 7 East, Suite 202 Markham, ON, L3R 2A2

A signed Plan of Survey, prepared by Dasha Page, O.L.S., by J.D. Barnes Limited, dated July 19, 2022, is included in Appendix B.

1.2 Potentially Contaminating Activities and Areas of Potential Environmental Concern

A Phase One ESA, in accordance with O. Reg. 153/04, has been completed by EXP (dated October 7, 2024) for the Site. Several potentially contaminating activities (PCAs) were identified on-Site and within 250 m from the Phase One Property site boundaries. All PCAs that were identified within 250 m property are shown on Figure 2.

Each PCA was further evaluated to determine if the activity may be contributing to an area of potential environmental concern (APECs) at the Phase One Property. The potential for each PCA to result in an APEC was evaluated based on the nature of the activity, the proximity to the Site and the location of the PCA relative to the calculated groundwater flow direction to the northwest.

Figures 2 and 4 illustrate the PCAs and associated APECs, respectively. The PCAs are summarized as follows:

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
Site (On-Site PCAs)					
1	1544 Four Mile Creek Road	On-Site	#27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Based on the previous report and city directories, a marine repair shop operated in the on-Site garage from approximately 1964 until 2023.	Yes
2A	1544 Four Mile Creek Road	On-site	#30 - Importation of Fill Material of Unknown Quality	Based on the previous report, slag from the former General Motors Plant was historically imported to the northern portion of the Site.	Yes
2B	1544 Four Mile Creek Road	On-Site	#Other – De-icing Activities	Salting activities of roadways and nearby parking areas for the purpose of keeping pedestrian and vehicular traffic safe	Yes
3	1544 & 1546 Four Mile Creek Road	On-Site	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the previous report, two (2) USTs were reportedly historically located southeast of the garage structure and west of the residential building.	Yes
4	1544 & 1546 Four Mile Creek Road	On-Site	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	Based on 1876 historic map, an orchard/vineyard was located at the southern portion of the Site.	Yes

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
5	1546 Four Mile Creek Road	On-Site	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the previous report and current site inspection, vent/fill pipes were observed at the northern portion of the residential house, indicating a potential fuel oil AST/UST.	Yes
Surrounding Properties (Off-Site PCAs)					
6	n/a	30 metres east	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	Based on the aerial photographs, an orchard/vineyard was located east of the Site.	No, based on the cross-gradient location relative to the Site.
7	1579 Four Mile Creek Road	40 metres north	#40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	Based on the ERIS report and city directories, Niagara Fruit & Vegetable Growers Ltd. was listed as a wholesale pesticide vendor, and was located at the property between 2006 and 2023.	No, based on the cross-gradient location relative to the Site.
8a	1593 Four Mile Creek Road	70 metres northeast	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the ERIS report, The Town of Niagara-on-the-Lake Works yard is registered as a private fuel outlet with two (2) gasoline USTs and one (1) diesel UST.	No, based on the cross-gradient location relative to the Site.
8b	3 Lorraine Street	70 metres northeast	#other - spill	Based on the ERIS report, two spills occurred at the Town Works Yard; an unknown volume of gasoline in 2008 and 50 litres of diesel in 1988.	No, based on the cross-gradient location relative to the Site.
8c	1593 Four Mile Creek Road/3 Lorraine Street	70 metres northeast	#52 – Storage, maintenance, fuelling and repair of equipment, vehicles, and material used to maintain transportation systems.	Based on the ERIS report, this property was listed as a waste generator for the Town Works Yard (believed to be related to equipment repair activities) since 1986.	No, based on the cross-gradient location relative to the Site.

PCA Identifier	Address	Location of Activity (in relation to Site)[1]	Potentially Contaminating Activity (PCA)[2]	Approximate timeline that PCA occurred	Contributes to APEC (Yes or No)?
9	1593 Four Mile Creek Road	70 metres northeast	#58 – Waste Disposal and Waste Management, including thermal treatment, landfilling and transfer of waste, other than use of biosoils as soil conditioners.	Based on the ERIS report, this property was listed as a waste generator for a waste collection operation since 2007.	No, based on the cross-gradient location relative to the Site.
10a	1487 Niagara Stone Road	145 metres north	#28 – Gasoline and Associated Products Storage in Fixed Tanks	Based on the ERIS report and city directories, a gasoline station has been located at this property since 1988.	No, based on the cross-gradient location relative to the Site.
10b	Corner of Lorraine Road and Four Mile Creek Road	145 metres north	#other - spill	Based on the ERIS report, a gasoline spill of unknown volume occurred at the property.	No, based on the cross-gradient location relative to the Site.
10c	Lorraine Road and Four Mile Creek Road	145 metres north	#other - spill	Based on the ERIS report, a mercury spill occurred at this property.	No, based on the cross-gradient location relative to the Site.
11	7 Henegan Road, Niagara-On-The-Lake	155 meters west	#27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	Based on the city directories, Whirlpool Jet Boat Tours has been located at the property since 2006. There is potential for boat maintenance and repair activities in the building.	No, based on the cross-gradient location relative to the Site.
12	11 Henegan Road, Niagara-On-The-Lake	160 metres west	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, multiple woodworking companies have been located at the property since 2006.	No, based on the downgradient location relative to the Site.
13	13 Henegan Road, Niagara-On-The-Lake	165 metres southwest	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, multiple woodworking companies have been located at the property since 2009.	No, based on the downgradient location relative to the Site.
14	15 Henegan Road, Niagara-On-The-Lake	220 metres southwest	#59 - Wood Treating and Preservative Facility and Bulk Storage of Treated and Preserved Wood Products	Based on the city directories, Millbrook Cabinetry Inc. has been located at the property since 2006.	No, based on the downgradient location relative to the Site.

(1) Distances are approximate. Precise distances are not possible due to the age of some listings and the aggregation and/or loss of addresses.
(2) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg 153/04, as amended) that is occurring or has occurred in a phase one Study area.

The APECs, as presented in Figure 4, and the associated contaminants of potential concern (COPCs) in the media associated with the PCA were summarized and assessed as follows:

Area of Potential Environmental Concern (APEC)	Location of APEC on Phase One Property	Potentially Contaminating Activity (PCA)[1]	Location of PCA (on-Site or off-Site)	Contaminants of Potential Concern[2]	Media Potentially Impacted (Groundwater, soil and/or sediment)
APEC 1: Former equipment and marine vehicle repairs	Central portion of the Site	PCA 1: #27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil and Groundwater
APEC 2A: Importation of Fill Material	Northern portion of the Site	PCA 2: #30 - Importation of Fill Material of Unknown Quality	On-Site	PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg, EC, SAR, PCBs	Soil
APEC 2B: De-icing Activities	Northern portion of the Site	PCA 2B: #Other – De-icing Activities	On-Site	EC, SAR	Soil
APEC 3: Former USTs	South-Central portion of the Site	PCA 3: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, VOCs, Metals, Sb, As, Se	Soil and Groundwater
APEC 4: Historical orchard/vineyard	Southern portion of the Site	PCA 4: #40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	On-Site	OC Pesticides, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil
APEC 5: Vent/fill pipes at residential structure	Southeastern portion of the Site	PCA 5: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	PHCs, BTEX, PAHs, VOCs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil and Groundwater

(1) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O.Reg.153/04, as amended) that is occurring or has occurred in a phase one Study area.
(2) PHCs – Petroleum Hydrocarbons; BTEX – Benzene, Toluene, Ethylbenzene, and Xylene; VOCs – Volatile Organic Compounds; PAHs – Polycyclic Aromatic Hydrocarbons; Metals – Metals (including Hydride Metals); ORPs – Other Regulated Parameters [EC - electrical conductivity; SAR - sodium adsorption ratio; Hg – mercury; CN – cyanide; B-HWS - boron (hot-water-soluble); CrVI - hexavalent chromium; and pH]; OC pesticides – Organochlorine pesticides; PCBs – polychlorinated biphenyls.

1.3 Underground Utilities

The Site utilities and services were identified at the Site based on information provided in environmental records, relevant utility infrastructure observed during the Site reconnaissance, and the information from the locates that were completed for the Site. The Site utilities are summarized as follows and noted on Figure 3, where available. The site is serviced by the following:

Utility	Source	Site Entry
Natural Gas	Enbridge Gas	Underground from Four Mile Creek Road
Sanitary Sewer	Town of Niagara-on-the-Lake	Underground from Four Mile Creek Road
Storm Sewer	Town of Niagara-on-the-Lake	Underground from Four Mile Creek Road
Water	Town of Niagara-on-the-Lake	Underground from Four Mile Creek Road
Electricity	Niagara-on-the-Lake Hydro Inc.	Underground / Overhead
Telecommunications	Bell, Rogers	Underground from Four Mile Creek Road

The subsurface structures or utilities may provide preferential pathway of the identified contaminants of concern (COCs) in groundwater at the Site. Given the minimum depth to groundwater identified on-Site of 0.41 metres below ground surface (mbgs), utility conduits may provide a preferential flow path for groundwater. However, based on the distribution of groundwater contaminants observed at the Site from Figure 17, it does not appear that any contaminant plumes are travelling along preferential pathways via utility lines.

2. Physical Site Description

2.1 Geological Conditions

The following physiographic, geological and soil maps were reviewed:

- Topographic Map available at the Natural Resources Canada (NRC) website http://atlas.gc.ca/toporama/en/index.html
- Make A Map: Natural Heritage Areas at Ontario Ministry of Natural Resources and Forestry website https://www.lioapplications.lrc.gov.on.ca/Natural_Heritage/index.html?viewer=Natural_Heritage.Natural_Heritage&locale=en-CA
- "Quaternary Geology, Seamless coverage of the Province of Ontario"; Data Set 14 - Revised, Scale 1: 1,000,000 Issued 2000.
- "Bedrock Geology of Ontario, Southern Sheet," Ontario Geological Survey, MDR126-REV1. Scale 1:250,000. Issued 2011.
- 1876 Illustrated Historical Atlas of the Counties of Lincoln and Welland, Ont., Digital Library of McGill University.

Based on the review of the above maps, the following information was obtained:

- Based on the information available at this time, the direction of groundwater flow around the Site is to the northwest. The Lower Virgil Reservoir is located approximately 5 metres west of the Site. The Lower Virgil Reservoir is part of Four Mile Creek, which is located approximately 10 metres northwest of the Site, and flows north towards Lake Ontario.
- Based on the review of available resources from the Ministry of Natural Resources and Forestry website, a wetland is located northwest adjacent to the Site, extending slightly onto northern portion of the Site. The wetland is associated with Four Mile Creek. Based on the Town of Niagara-on-the-Lake Official Plan, this wetland is understood to be a provincially significant wetland.

- The Site and surrounding areas are dominated by Iroquois Plain deposits that consist predominantly of clay to silt-textured till (derived from glaciolacustrine deposits or shale) with Modern alluvial deposits consisting of clay, silt, sand, and gravel in the western-most portion of the Site.
- The bedrock in the general area of the Site is part of a group belonging to the Queenston Formation, primarily consisting of shale, limestone, dolostone and siltstone.
- Based on the Ontario Geological Survey (OSG) Bedrock Geology Database, depth to bedrock at the Site is approximately 19 mbgs.
- According to the historical map, the Site was located within the property owned by John A. Wilson and was used for agricultural purposes including an orchard/vineyard at the southern portion.

According to Schedule C of the *Town of Niagara-on-the-Lake Official Plan (2017),* the Site is listed as a Service Commercial Area and is adjacent to a Conservation Area. The Site is included in a 'Wetlands Area' (including adjacent lands). According to Part 3 – Land Use Policies, the Four Mile Creek estuary is understood to be a provincially significant wetland.

2.2 Stratigraphy

The general stratigraphy at the Site, as observed in the boreholes, consists of topsoil or granular fill, underlain by silty clay to sandy silt fill, overlying native layers of clayey silt, and silty clay till (BH1). Bedrock was not encountered at the borehole completion depths, to a maximum investigative depth of 11.28 mbgs.

2.2.1 Surface Material

Surficial topsoil was encountered at BH2, BH3, BH4, BH5, BH7, and BH8, with a thickness ranging from 50 to 150 mm. BH7 encountered approximately 200 mm of granular fill beneath the surficial topsoil layer.

BH1 and BH6 were advanced in the gravel driveway and encountered approximately 250 and 450 mm of surficial granular fill.

The granular fill typically consisted of crushed limestone

2.2.2 Fill Material

Fill material was encountered at all borehole locations beneath the surficial material, except for BH2 and BH3, extending from approximately 0.8 to 9.14 mbgs. Fill material consisted of silty clay, gravelly sand, silty sand, or sandy silt, and was noted to contain trace to some organics, trace wood, brick, and asphalt fragments, and deleterious materials.

2.2.3 Native Material

A native deposit of silty clay was encountered at all borehole locations except for BH1, where a native sandy silt was encountered under the fill, extending from 9.14 to the borehole termination depth of 11.28 mbgs. Native silty clay was encountered directly below topsoil at BH2 and BH3, extending from approximately 0.5 to the borehole termination depth of 8.2 mbgs, and was encountered at depths ranging from 0.75 to 7.6 mbgs in BH4, BH5, BH6, BH7, and BH8.

All boreholes were terminated in native material at depths ranging from 6.71 to 11.28 mbgs. No odour or staining was identified in the native material.

2.2.4 Bedrock

Bedrock was not encountered at the boreholes advanced at the Site to the maximum investigative depth of 11.28 mbgs

2.3 Hydrogeology

The monitoring well network consisted of six (6) monitoring wells (BH1-23, BH2-23, BH5-23, BH3, BH4 and BH7) screened within the fill material and native soils. On October 2, 2024 (round 1), the measured depth of the groundwater table ranged from 0.41 (BH1-23) to 1.67 (BH2-23) mbgs; the calculated groundwater elevations ranged from 90.87 (BH2-23) to 92.24 (BH1-23) masl in

the groundwater monitors. On December 2, 2024 (round 3), the measured depth of the groundwater table ranged from 0.7 (BH1-23/BH4) to 6.7 (BH3) mbgs; the calculated groundwater elevations ranged from 85.84 (BH3) to 91.95 (BH1-23) masl in the groundwater monitors. The calculated hydraulic gradient value for the monitoring wells was an average of 0.1 m/m to 0.01 m/m to the north to northwest.

Using a value of 1.0 x 10^{-7} m/s for the hydraulic conductivity of the, a calculated hydraulic gradient of 0.01 m/m, and 20% for effective porosity of clayey silt to silty clay (McWhorter and Sunada, 1977), Darcy's Law calculations were made to determine the potential groundwater flow velocity at the Site. The groundwater flow velocity was calculated to be approximately 0.0016 metres per year in the water-bearing clayey silt to silty clay.

Taking into consideration surface water features in the surrounding area, the regional groundwater flow direction is inferred to be northwesterly. Localized flow conditions across the site indicate a groundwater flow to the north/northwest in the unconfined clayey silt to silty clay aquifer; a groundwater contour plan is shown in Figure 6A and 6B.

All measurements of groundwater and liquid petroleum (if any) depth were made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape that came into contact with liquids within the monitor are cleaned with Alconox detergent, and then rinsed with distilled water and methanol and allowed to air dry after each measurement.

2.4 Site Sensitivity

The Site Sensitivity classification with respect to the conditions set out under Section 35, 41 and 43.1 of O. Reg. 153/04, as amended, were evaluated to determine if the Site is sensitive:

Sensitivity	Classification	Does Sensitivity Apply to Site?
Section 35 applies if	(i) The full depth generic site condition standards in a non-potable groundwater condition	No
	(ii) The stratified site condition standards in a non-potable groundwater condition	No
	(iii) The property, and all other properties located, in whole or in part, within 250 metres of the boundaries of the property, are supplied by a municipal drinking water system	Yes
	(iv) The record of site condition does not specify agricultural or other use as the type of property use	Yes
	(v) The property is located in an area designated in the municipal official plan as a well-head protection area or other designation identified by the municipality for the protection of groundwater	No
	(vi) The property or one of the properties in the phase one study area has a well used or intended for use as a source of water for human consumption or agriculture.	Yes
	(vii) A person authorized by the owner of a property has given the clerk of the municipality a written notice of intention to apply the standards in preparing a record of site condition for the property; A. the single tier municipality has given written notice that it does not object to the application of the standards	No
Section 41 applies if	(i) property is within an area of natural significance	Yes
	(ii) property includes or is adjacent to an area of natural significance or part of such an area	Yes
	(iii) property includes land that is within 30 m of an area of natural significance or part of such an area	Yes
	(iv) soil at property has a pH value for surface soil less than 5 or greater than 9	Yes

Sensitivity	Classification	Does Sensitivity Apply to Site?
	(v) soil at property has a pH value for sub-surface soil less than 5 or greater than 11	No
	(vi) a qualified person is of the opinion that, given the characteristics of the property and the certifications the qualified person would be required to make in a record of site condition in relation to the property as specified in Schedule A, it is appropriate to apply this section to the property	No
Section 43.1 applies if	(i) property is a shallow soil property	No
	(ii) property includes all or part of a water body or is adjacent to a water body or includes land that is within 30 m of a water body	Yes

2.5 Areas on, in or under the Phase Two Property where Excess Soil is finally placed

Fill material was encountered during the investigation and is considered an APEC, and as such, the quality of the fill material was assessed. No Excess Soil was imported from another property and placed on-Site during the Phase Two ESA investigation.

2.6 Land Use

It is EXP's understanding that the Client intends to re-develop the Site as mixed residential and commercial land use. Although conceptual plans were provided in draft at the time of this Phase Two ESA, it was assumed that two buildings would be constructed: a forty (40) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. No underground parking is proposed, at this time. However, at-grade parking it proposed for the central portion of the Site, between the two proposed building structures.

3. Contaminants of Concern

3.1 Applicable Site Condition Standards

For assessment purposes, EXP selected the MECP (2011) Table 1: Full Depth Background SCS for Residential/Parkland/Institutional/Commercial/Community/Industrial (RPI/ICC) property use, and medium to fine textured soils (hereinafter referred to as the "Table 1 SCS"). The selection of this category was based on the following factors:

- As per the requirements of Section 43.1 of O. Reg. 153/04, a property is considered to be a "shallow soil property" if 1/3 or more of the property consists of soil equal to or less than 2 m in depth beneath the soil surface. More than 1/3 of the boreholes advanced at the Site indicated an overburden thickness greater than 2 m, and as such, the Site is not considered as a "shallow soil property";
- The Site was considered as a sensitive Site as defined by O. Reg. 153/04 on the following basis:
  - The Site is located on or within 30 m of an area of natural significance as defined in O. Reg. 153/04. Based on the review of available resources from the Ministry of Natural Resources and Forestry website, a wetland is located northwest adjacent to the Site, extending slightly onto northern portion of the Site. The wetland is associated with Four Mile Creek. Based on the Town of Niagara-on-the-Lake Official Plan, this wetland is understood to be a provincially significant wetland;
  - According to Schedule C of the *Town of Niagara-on-the-Lake Official Plan (2017),* the Site is adjacent to a Conservation Area;

  - Six (6) surface soil samples and six (6) subsurface soil samples, including one (1) QA/QC field duplicate (QA/QC and BH7-SS11), were submitted for pH analysis. The pH of all soil samples ranged from 6.87 to 11.4. As such, the pH of surface soils at the Site is considered to be a "Sensitive Site" as per O. Reg. 153/04, Section 41; and,
  - The Site is located within 30 m of a water body.
- The stratigraphy of the Site predominantly consists of medium to fine textured soil, based on the borehole logs and grain size analysis for the Site, where native soils were identified as silty clay to clayey silt;
- Based on the ERIS database records and Ontario Well Records, one (1) domestic well was identified within the study area;
- The Site is intended to be utilized for mixed residential and commercial land use, with residential land use as the most sensitive land use; and,
- There was no intention to carry out a stratified restoration at the Site.

3.2 Areas of Contamination and Distribution of Contaminants

Subsurface investigations were completed to assess the impact of the PCAs on soil and groundwater within APECs on the Site. The screening of contaminants of concern (COC) was done by comparing the concentrations of potential contaminants of concern (PCOCs) in soil and groundwater with the Table 1 SCS. The potential soil COCs associated with the identified APECs are petroleum hydrocarbons (PHCs) including benzene, toluene, ethylbenzene and xylenes (collectively referred to as "BTEX"), volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), organochlorine pesticides (OCs), polychlorinated biphenyls (PCBs), metals (including hydride-forming metals), other regulated parameters (ORPs) (including mercury (Hg), cyanide (CN-), boron [hot-water-soluble] (B-HWS), hexavalent chromium (Cr (VI)), pH, electrical conductivity (EC) and sodium adsorption ratio (SAR)). The potential groundwater COCs associated with the identified APECs are PHCs including BTEX, VOCs, PAHs, metals (including hydride-forming metals), ORPs (including Hg, CN, Cr (VI), sodium (Na) and chloride (Cl)). A summary of the assessment of APECs is provided as follows:

APEC	Location of APEC on Phase Two Property	PCA[1]	Location of PCA	COPC and Media Affected	Phase Two Assessments	Current Status (Exceedances of Table 1 SCS)
APEC 1: Former equipment and marine vehicle repairs	Central portion of the Site	PCA 1: #27 - Garages and Maintenance and Repair of Railcars, Marine Vehicles and Aviation Vehicles	On-Site	Soil and Groundwater: PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	<u>Soil:</u> Two (2) soil samples and one (1) duplicate sample were submitted for PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg. Four (4) soil samples and one (1) duplicate were submitted for PHCs, BTEX, and VOCs. <u>Groundwater:</u> ***Round 1:*** Three (3) groundwater samples (BH2-23, BH5-23, and BH4) and one (1) duplicate sample	<u>Soil:</u> Exceedances of PHC fraction F2 were identified at BH4, from a depth of 1.52 - 2.13 mbgs. This was vertically delineated to 6.05 mbgs. <u>Groundwater:</u> Exceedances of metals (cobalt, uranium, vanadium) were identified at BH2-23, screened at 4.42 - 7.47, BH5-23, screened at 5.33 - 6.85 mbgs, respectively. (cobalt, uranium and vanadium) at BH2-23, BH5-23, BH3, and BH7.

APEC	Location of APEC on Phase Two Property	PCA[1]	Location of PCA	COPC and Media Affected	Phase Two Assessments	Current Status (Exceedances of Table 1 SCS)
					(BH5-23-0) were submitted for PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg. ***Round 2:*** Two (2) groundwater samples (BH3, BH7) and one (1) duplicate (BH7-0) were submitted for PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg. One (1) groundwater sample (BH4) was submitted for PAHs, PHCs, BTEX. Two (2) groundwater samples (BH2-23, BH5-23) were submitted for Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg. ***Round 3:*** One (1) groundwater sample (BH4) and one (1) duplicate (BH4-0) were submitted for PHCs, BTEX, PAHs. Three (3) groundwater sample (BH5-23, BH3, BH7) were submitted for Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg.	
APEC 2A: Importation of Fill Material	Northern portion of the Site	PCA 2A: #30 - Importation of Fill Material of Unknown Quality	On-Site	Soil: PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg, EC, SAR, PCBs	<u>Soil:</u> Two (2) soil samples were submitted for PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg, and PCBs. Three (3) soil samples were submitted for EC and SAR.	<u>Soil:</u> Exceedances of EC was identified at BH5 at 0.0 - 0.61 mbgs. This was vertically delineated to 6.09 mbgs.
APEC 2B:	Northern	PCA 2B: #Other	On-Site	Soil: EC, SAR	<u>Soil:</u>	<u>Soil:</u>

APEC	Location of APEC on Phase Two Property	PCA[1]	Location of PCA	COPC and Media Affected	Phase Two Assessments	Current Status (Exceedances of Table 1 SCS)
Salting activities in winter months	portion of the Site	– De-icing Activities			Two (2) soil samples were submitted for PHCs, BTEX, VOCs, PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg, and PCBs. Three (3) soil samples were submitted for EC and SAR.	Exceedances of EC was identified at BH5 at 0.0 - 0.61 mbgs. This was vertically delineated to 6.09 mbgs.
APEC 3: Former USTs	South-Central portion of the Site	PCA 3: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	Soil and Groundwater: PHCs, BTEX, VOCs, Metals, Sb, As, Se	<u>Soil:</u> Two (2) soil samples were submitted for PHCs, BTEX, and VOCs. One (1) soil sample was submitted for Metals, Sb, As, Se. <u>Groundwater:</u> ***Round 1:*** Two (2) groundwater samples (BH4, BH1-23) was submitted for PHCs, BTEX, VOCs, and Metals, Sb, As, Se. ***Round 2:*** November: One (1) groundwater sample (BH4) was submitted for PHCs, BTEX. ***Round 3:*** One (1) groundwater sample (BH4) and one (1) duplicate (BH4-0) were submitted for PHCs, BTEX.	<u>Soil:</u> Exceedances of PHC fraction F2 were identified at BH4, from a depth of 1.52 - 2.13 mbgs. This was vertically delineated to 6.05 mbgs. <u>Groundwater:</u> No exceedances were identified in groundwater samples.
APEC 4: Historical orchard/vineyard	Southern portion of the Site	PCA 4: #40 - Pesticides (including Herbicides, Fungicides and Anti-Fouling Agents) Manufacturing, Processing, Bulk Storage and Large-Scale Applications	On-Site	Soil: OC Pesticides, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	<u>Soil:</u> Four (4) soil samples and one (1) duplicate were submitted for OC pesticides, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	<u>Soil:</u> No exceedances were identified in the soil samples.

APEC	Location of APEC on Phase Two Property	PCA[1]	Location of PCA	COPC and Media Affected	Phase Two Assessments	Current Status (Exceedances of Table 1 SCS)
APEC 5: Vent/fill pipes at residential structure	Southeastern portion of the Site	PCA 5: #28 – Gasoline and Associated Products Storage in Fixed Tanks	On-Site	Soil and Groundwater: PHCs, BTEX, PAHs, VOCs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN-, Hg	Soil: Two (2) soil samples were submitted for PHCs, BTEX and VOCs. One (1) soil sample was submitted for PAHs, Metals, Sb, As, Se, HWS-B, Cr(VI), CN, Hg Groundwater: ***Round 1:*** No groundwater sample was obtained at BH3 given that it was dry during the investigation(s). ***Round 2:*** One (1) groundwater sample (BH3) was submitted for PHCs, BTEX, VOCs, and Metals, Sb, As, Se. ***Round 3:*** One (1) groundwater sample (BH3) was submitted for Metals, Sb, As, Se.	Soil: No exceedances were identified in the soil samples. Groundwater: Exceedances for uranium were identified at BH3, with a well screened at 4.57 - 7.62.

(1) Potentially contaminating activity means a use or activity set out in Column A of Table 2 of Schedule D (O. Reg. 153/04, as amended) that is occurring or has occurred in a phase one Study area.

3.3 Soil COCs

Soil was within the Table 1 SCS for all parameters analyzed with the exception of PHC fraction F2 at BH4, from 1.52 - 2.13 mbgs. The exceedance was vertically delineated to 6.09 mbgs, and horizontally delineated to BH3 to the east, BH7 to the northwest and BH2 to the northeast. These horizontal delineation samples were all obtained from 1.52 - 2.13 mbgs. The PHC exceedance is shown in plan view on Figure 7 and profile view on Figures 19A and 20A.

It is noted that elevated levels of EC were identified at BH5, however the elevated levels are related to the application of salting and de-icing substances in the parking lot and driveways for the purpose of snow and ice removal during the winter months. As per Section 2 of Ontario Regulation 339 of the Revised Regulations of Ontario, 1990 (Classes of Contaminants – Exceptions), and Part IX, Subsection 49.1 of Ontario Regulation 153/04, the concentrations of EC are deemed not to be exceedances of the applicable site condition standards if the exceedances are resulted from the application of de-icing substances in the winter months. As such, it is the Qualified Persons (QP_{ESA}'s) opinion that the applicable Table 1 Standards for EC at the Site were

exceeded solely because salt was used in the parking lot and laneways for the purpose of keeping the area safe for traffic under conditions of snow or ice or both, and therefore these parameters are not considered COCs. Elevated levels of EC are shown in plan view on Figure 11.

3.4 Groundwater COCs

Groundwater was within the Table 1 SCS for all parameters analyzed, with the exception of metals (cobalt, uranium and vanadium) at BH2-23, BH5-23, BH3, and BH7. These metal exceedances have not been vertically delineated

Metal exceedances were identified in the vicinity of the equipment and marine vehicle repair shop, as shown in Figure 17. Groundwater impacts have not been fully vertically or horizontally delineated.

No evidence of free products was observed in groundwater during the investigation.

3.5 Sediment COC

No sediment was present at the Site. As such, sediment sampling was not conducted.

3.6 Mechanism of Discharge of Contaminants

The areas where each soil and groundwater COC group is present at concentrations above the Table 1 SCS, if applicable, are shown on Figures 7, 14, and 17.

Table 6 below summarizes the COCs associated with the areas of contamination (AOCs).

Table 6: Summary of COCs Associated with AOCs

AOC Source(s)	Location	COCs in Excess of Table 1 SCS	Medium
Associated with APEC 1	Southwestern portion of the Site	Metals (cobalt and vanadium)	Groundwater
N/A – Background conditions	Southern portion of the Site	Uranium	Groundwater
Associated with APEC 3	South-central portion of Site	PHC Fraction F2	Soil

The PHC Fraction F2 exceedance identified in soil at BH4 is likely associated with the historic UST formerly located on Site, located on the west side of the residential home and southeast of the garage.

The metal exceedances (cobalt and vanadium) identified in groundwater at monitoring well BH5-23 are likely associated with the equipment and marine vehicle repair shop (APEC 1). Uranium exceedances identified in groundwater at monitoring wells BH3, BH7, BH2-23, and BH5-23 are likely associated with background conditions, representative of the bedrock and soil type in the vicinity of the Site.

3.7 Migration of Contaminants

The preferential pathways for contaminants present in soil and groundwater media, include various underground utilities, building footings and subsurface features.

Underground utilities were identified at the Site. As such, there is a potential for underground utilities to affect the distribution and transport of groundwater and soil vapour contaminants located on the Site.

Details on the preferential pathways for the impacts are summarized in Table 7.

Table 7: Preferential Pathways

Anything known about migration of the contaminants present on, in or under the phase two property at a concentration greater than the applicable site condition standard away from any area of potential environmental concern, including the identification of any preferential pathways.	Current utilities may affect groundwater and soil vapour migration. Future utilities may affect groundwater and soil vapour migration. Current and future building footings may affect groundwater and soil vapour migration.

3.8 Climatic and Meteorological Conditions Affecting Migration

Given the presence of volatile COCs in soil, vapour intrusion is a potential contaminant transport mechanism for volatile COCs in soil. Intrusion of vapour-phase contaminants into the indoor air occurs from volatilization of chemicals from the dissolved or non-aqueous phases in the subsurface.

The relevant mechanisms for vapour intrusion are soil gas advection and vapour migration from diffusion through the building foundation. Soil gas advection is the dominant mechanism when the pressure gradient is greater than 1 Pascal (MECP 2011b), as is the case in many residential buildings due to building depressurization. Soil gas advection can occur through any unsealed entry points, cracks or openings present in the building foundation.

Soil vapour flow is greatest within 1 m to 2 m below the building foundation (MECP 2011b); as such, the soil permeability of backfill beneath the building foundation will affect the soil vapour flow rate. Furthermore, pressure gradients (i.e. depressurization of the indoor airspace of the building) created by temperature differences between indoor and outdoor air may affect soil gas flow rate by creating a "stack effect" where, as warm air rises, it is replaced by air infiltrating through doors and windows, and soil gas migrating through the foundation.

As such, in the event that the vapour intrusion pathway is present there may be potential for unacceptable health risks to building occupants via inhalation of indoor air.

3.9 Soil Vapour Intrusion

Given the presence of PHC fraction F2 in soil at BH4-SS3 (depth of 1.52 to 2.13 mbgs) soil vapour intrusion pathways are considered possible in the existing and future Site buildings.

Existing Site Buildings

Construction Features

The Site was occupied by a split-level residential home and a detached, formerly commercial garage. The remainder of the Site consisted of an asphalt parking lot and landscaped areas. Drains were observed in the garage building. There were no other drains, pits, or sumps observed during the Phase One ESA Site visit.

Heating, Ventilating and Air Conditioning Systems

At the time of the Phase One ESA Site visit, both buildings utilized natural gas heating with additional electric baseboard heaters noted in the office portion of the garage structure. Evidence of oil tank fill and vent pipes were observed on the north side of

the residential house (1544 Four Mile Creek Road) next to the current natural gas meter. Window/wall mounted air conditioning units were observed at both structures.

Utilities

Natural gas is currently supplied by Enbridge. Hydro was supplied by Niagara-on-the-Lake Hydro Inc. Natural gas is supplied underground and hydro is supplied both overhead and underground.

The buildings were all serviced by municipal water and sewers. The Town of Niagara-on-the-Lake obtains its potable water from Lake Erie.

Additional details of subsurface structures and utilities are discussed in Section 1.3.

Future Site Buildings

Although the development plan for the Site has yet to be finalized, it is understood that the Site is intended to be redeveloped for mixed residential and commercial land use, with two (2) buildings to be constructed: a forty (40) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. No underground parking is proposed, at this time. However, at-grade parking it proposed for the central portion of the Site, between the two proposed building structures.

As volatile soil COCs were identified, vapour intrusion pathways are considered complete and there is potential for vapour intrusion under current Site conditions and upon redevelopment in the future Site buildings. To mitigate potential vapour intrusion, for the current Site conditions and future Site buildings, risk management measures or remedial measures are recommended.

4. Exposure Pathways

The human health conceptual site model (HHCSM) and ecological conceptual site model (ECSM), respectively, provide diagrams showing the contaminant sources, release and transport mechanisms, exposure routes, and possible receptors. The CSMs identify the complete exposure pathways where receptors might make direct contact with the COCs identified in soil and groundwater, or where they may indirectly be exposed to COCs in soil and groundwater via vapour transport or other pathways. Additionally, the CSM identifies pathways that are considered insignificant or negligible where the pathway may be incomplete or blocked.

4.1 Human Health Receptors and Exposure Pathways

The Site is currently occupied by a split-level residential home and a detached, formerly commercial garage. Although the development plan for the Site has yet to be finalized, it is understood that the Site is intended to be redeveloped for mixed residential and commercial land use, with two (2) buildings to be constructed: a forty (40) unit, four (4) storey residential condominium and a two (2) storey commercial building with retail and office space. No underground parking is proposed, at this time. However, at-grade parking it proposed for the central portion of the Site, between the two proposed building structures. Therefore, the receptors chosen for analysis are Site residents (toddlers and adults), Site visitors (recreational and trespassers [child and adult]), indoor workers, and outdoor workers (i.e. maintenance worker). Construction/subsurface utility workers may also be present during redevelopment of the Site.

Based on the soil and groundwater COCs identified at the Site, possible routes of exposure for human receptors include the following:

- Indirect exposure to soil COCs through inhalation of soil/dust particles blown on-Site during high intensity soil works/development for on-Site residents, on-Site visitors, on-Site outdoor maintenance workers, and on-Site construction/subsurface utility workers;

- Direct exposure to soil COCs through dermal contact and incidental ingestion by on-Site residents, on-Site visitors, on-Site outdoor maintenance workers, and on-Site construction/subsurface utility workers;
- Indirect exposure to soil and groundwater COCs via ingestion of garden produce by on-Site residents and on-Site visitors;
- Inhalation and vapour skin contact exposure to volatile COCs released to indoor air from soil for on-Site residents, on-Site visitors, and on-Site indoor workers;
- Inhalation and vapour skin contact exposure to volatile COCs released to outdoor air from soil for on-Site residents, on-Site visitors, and on-Site outdoor maintenance workers;
- Inhalation and vapour skin contact exposure to volatile COCs released to outdoor air (ground level) and trench air from soil for on-Site construction/subsurface utility workers; and,
- Direct exposure to groundwater through dermal contact and incidental ingestion by on-Site construction/subsurface utility workers.

Off-Site human receptors consist of the same receptors found on-Site. Possible routes of exposure for off-Site human receptors include the following:

- Indirect exposure to soil COCs through inhalation of soil/dust particles blown off-Site during high intensity soil works/development for off-Site residents, off-Site visitors, off-Site outdoor maintenance workers, and off-Site construction/subsurface utility workers;
- Inhalation and vapour skin contact exposure to volatile COCs released to indoor air from soil for off-Site residents, off-Site visitors, and off-Site indoor workers;
- Inhalation and vapour skin contact exposure to volatile COCs released to outdoor air from soil for off-Site residents, off-Site visitors, and off-Site outdoor maintenance workers;
- Inhalation and vapour skin contact exposure to volatile COCs released to outdoor air (ground level) and trench air from soil for off-Site construction/subsurface utility workers;
- Direct exposure to groundwater through dermal contact and incidental ingestion by off-Site construction/subsurface utility workers;
- Indirect contact to soil and groundwater COCs via dermal contact and incidental ingestion with surface water by off-Site recreational visitors and trespassers, and off-Site outdoor maintenance workers;
- Indirect contact to soil and groundwater COCs via ingestion of fish by off-Site recreational visitors and trespassers; and,
- Indirect contact to soil and groundwater COCs via dermal contact and incidental ingestion of sediment by off-Site recreational visitors and trespassers, and off-Site outdoor maintenance workers.

The potential exposure routes for on- and off-Site human receptors are summarized in Figure 22.

4.2 Ecological Receptors and Exposure Pathways

The selection of ecological receptors takes into consideration the location of the Site in an urban area and the location of the Lower Virgil Reservoir located approximately 5 metres west of the Site. The Lower Virgil Reservoir is part of the Four Mile Creek which is located approximately 10 metres northwest of the Site, and flows north towards Lake Ontario. Relevant on-Site receptors, as illustrated in the ECSM consist of terrestrial VECs such as plants, soil invertebrates, mammals, and birds.

Based on the soil and groundwater COCs identified at the Site, possible routes of exposure for on-Site ecological receptors include the following (as shown in Figure 23):

- Direct exposure to soil COCs through dermal contact, incidental ingestion, and/or particulate inhalation by soil invertebrates and terrestrial wildlife;
- Direct exposure to soil and groundwater COCs through root uptake by terrestrial plants;
- Ingestion of impacted food/prey by soil invertebrates and terrestrial mammals and birds;

- Indirect exposure to volatile COCs released from soil to outdoor air through atmospheric deposition by terrestrial plants; and,
- Indirect exposure to volatile COCs released from soil to outdoor air through inhalation and dermal contact by soil invertebrates and terrestrial wildlife.

Off-Site ecological receptors consist of the same terrestrial receptors found on-Site. Furthermore, the MECP evaluates exposure to aquatic receptors at properties within 5 km of a surface water body. Given that the nearest surface water feature is the Lower Virgil Reservoir located approximately 5 metres west of the Site, aquatic receptors are also considered. Relevant exposure pathways for off-Site aquatic receptors include aquatic plants, aquatic invertebrates, aquatic birds and mammals, amphibians and fish. Off-site exposure routes include the following (as shown in Figure 23):

- Direct exposure to soil COCs through particulate inhalation by terrestrial birds and mammals;
- Indirect exposure to volatile COCs released from soil to outdoor air through atmospheric deposition by terrestrial plants;
- Indirect exposure to volatile COCs released from soil to outdoor air through inhalation and dermal contact by soil invertebrates and terrestrial wildlife;
- Indirect exposure through ingestion of impacted plant and animal tissue by soil invertebrates, terrestrial birds and mammals, aquatic invertebrates, aquatic birds and mammals, amphibians and fish;
- Direct exposure to groundwater COCs through root uptake by terrestrial plants;
- Direct exposure to surface water through root uptake by aquatic plants;
- Direct exposure to surface water through dermal contact and ingestion by terrestrial birds and mammals, aquatic invertebrates, aquatic birds and mammals, amphibians and fish;
- Direct exposure to surface water through gill intake by aquatic invertebrates, amphibians and fish;
- Direct exposure to sediment through root uptake by aquatic plants; and,
- Direct exposure to sediment through dermal contact and incidental ingestion by terrestrial birds and mammals, aquatic invertebrates, aquatic birds and mammals, amphibians and fish.

The potential exposure routes for on- and off-Site ecological receptors are summarized in Figure 23.

5. Uncertainty in the Phase Two Investigation

The investigation undertaken by EXP, and any conclusions or recommendations resulting from the work, reflect EXP's judgment based on the Site conditions observed at the time of EXP's site inspections and on information available at the time of preparation of the work. EXP has confirmed neither the completeness nor the accuracy of the records that were provided by others; as such, the historical records review is identified as a potential source of uncertainty during the investigation. The CSM is developed using multiple lines of evidence, searches and source information to make every reasonable attempt to ensure that findings of environmental significance are captured.

Any uncertainty or absence of information in the records review, interviews, and site reconnaissance components of the Phase One investigation, or any uncertainty or absence of information within the Phase Two or subsequent investigations, are not anticipated to materially affect the validity of the Phase Two CSM.
