FUNCTIONAL SERVICING REPORT

731 King Street, Niagara-On-The-Lake

April 2023

INTRODUCTION

The purpose of this report is to address the servicing needs for the proposed residential subdivision development in support of the applications for Zoning By-Law Amendment. The subject lands are located between 727 and 733 King Street in the Old Town Community of the Town of Niagara-on-the-Lake; north of King Street, west of Cottage Street, and south of Meritage Lane.

The development site is approximately 0.32 hectare and shall consist of 17 apartment units in a 3 storey building, and will include associated asphalt access and parking areas, concrete curb, catch basins, storm sewers, and sanitary sewers.

The objectives of this report are as follows:

1. Identify domestic and fire protection water servicing needs for the site;
2. Identify sanitary servicing needs for the site; and,
3. Identify stormwater management needs for the site.

WATER SERVICING

There is an existing municipal 150mm diameter watermain on King Street. It is proposed to connect a 150mm diameter water service to the existing 150mm watermain on King Street to provide both domestic water supply and fire protection. A private fire hydrant is required to provide fire protection, the location will be determined as part of the detailed engineering design.

Therefore, the existing water service on King Street will adequately provide domestic water supply and fire protection to the 17 unit building apartment.

SANITARY SERVICING

There is an existing 250mm diameter sanitary sewer on King Street which conveys sanitary flows to the northeast to Cottage Street. It is proposed to connect the new apartment building to the existing sanitary sewer on King Street and extend it within the site.

The proposed 0.32 hectare, 17 unit apartment building will produce a peak of approximately 0.91L/s, occupying 4.2% of the total capacity of the existing 250mm diameter sanitary sewer. Then, it is expected that this will be an adequate addition to the current capacity of the existing sanitary sewer.

STORMWATER MANAGEMENT

There are existing 450mm storm sewer on King Street, which convey stormwater flows southwest to Niagara Street, then southerly to Rye Street.

A Stormwater Drainage Area Plan was prepared in May 8, 2008 by Denco Engineering Ltd. (Denco) for the Town, as part of the King Street new storm sewer project, which delineated the storm drainage areas associated to the existing storm sewer system on King Street as shown in Appendix A.

In addition to the Stormwater Drainage Area Plan prepared by Denco Engineering, a new Stormwater Drainage Area plan was prepared by Upper Canada Consultants (UCC) as a part of the Royal Albion subdivision. As shown in the UCC plan attached in Appendix A, the storm drainage flows from the storm sewer on King Street, flow to Cottage Street and conveyed to the northwest towards Simcoe Street.

Figure 1, shows the Storm Drainage Areas from the original storm sewer design proposed by Denco where the 0.61 hectare with an associated Runoff Coefficient of 0.45 covers a portion. The original storm sewer calculations can be found in Appendix A.

The proposed and adjusted drainage areas and associated Runoff Coefficient is shown on Figure 2. The site stormwater system will collect a drainage area of 0.32 hectare at a Runoff Coefficient of 0.70. As shown in the proposed storm sewer calculation on Appendix A, the proposed conditions will produce a peak flow of 209.6 L/s, occupying 79.3% of the total capacity of the existing 450mm diameter storm sewer.

Therefore, since the majority the drainage areas A10 and A11 proposed by Denco will be conveyed to the existing Cottage Street storm sewer and the future proposed peak flows will be 11.0% less than the original peak flow proposed by Denco. It has been demonstrated that there will be adequate stormwater servicing capacity in the existing sewer network to serve the site without stormwater quantity controls.

To improve the quality of stormwater, an oil/grit separator will be utilized to provide MECP Normal Protection (70% TSS removal levels) as required for this type of development. It is estimated that a Hydroworks HD4 will provide 93% TSS removal. The complete stormwater design for this development will be identified as part of the future detailed design.

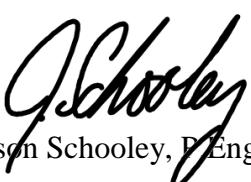

CONCLUSIONS AND RECOMMENDATIONS

Therefore, based on the above comments, drainage area plans and calculations provided for this site, the following summarizes the servicing for this site:

1. The existing 150mm diameter watermain on King Street is expected to have adequate capacity to provide both domestic water supply and fire protection to service the proposed 17 unit apartment building.
2. The receiving 250mm diameter sanitary sewers on King Street will have adequate capacity to service the Site.
3. The existing 450mm diameter stormwater sewer on King Street already has adequate capacity to serve the site.
4. Stormwater quality control will be provided to MECP Normal protection (70% TSS removal) levels prior to discharge from the site.

In conclusion, there exists adequate municipal servicing for this development. We trust the above comments and enclosed calculations are satisfactory for approval. If you have any questions or require additional information, please do not hesitate to contact our office.

Yours very truly,

Jason Schooley, P.Eng.

32b.INFILTRATION/INFLOW LOAD/ INLET LOAD (16a/18).....	0.
32c.CH/PIPE BMP FRACTION REMOVAL/ SUBCATCHMENT LOAD (17a/17) ..	0.
32d.CH/PIPE 1st ORDER DECAY REMOVAL/ SUBCATCHMENT LOAD (17b/17) ..	0.
33. INLET LOAD SUMMATION ERROR (18+8+6a+17a+17b-17)/17.....	0.

CAUTION. Due to method of quality routing (Users Manual, Appendix IX)
quality routing through channel/pipes is sensitive to the time step.

Large "Inlet Load Summation Errors" may result.

These can be reduced by adjusting the time step(s).

Note: surface accumulation during dry time steps at end of simulation is
not included in totals. Buildup is only performed at beginning of
wet steps or for street cleaning.
