FUNCTIONAL SERVICING REPORT

731 King Street, Niagara-On-The-Lake

December 2023

INTRODUCTION

The purpose of this report is to address the servicing needs for the proposed residential subdivision development in support of the applications for Zoning By-Law Amendment. The subject lands are located between 727 and 733 King Street in the Old Town Community of the Town of Niagara-on-the-Lake; north of King Street, west of Cottage Street, and south of Meritage Lane.

The development site is approximately 0.32 hectare and shall consist of 17 apartment units in a 3 storey building, and will include associated asphalt access and parking areas, concrete curb, catch basins, storm sewers, and sanitary sewers.

The objectives of this report are as follows:

1. Identify domestic and fire protection water servicing needs for the site;
2. Identify sanitary servicing needs for the site; and,
3. Identify stormwater management needs for the site.

WATER SERVICING

There is an existing municipal 150mm diameter watermain on King Street. It is proposed to connect a 150mm diameter water service to the existing 150mm watermain on King Street to provide both domestic water supply and fire protection. A fire hydrant is required to provide fire protection, the hydrant location will be at 45 metres from building connection.

Accordingly, with the fire hydrant testing and inspection report conduced in August 2021, for the existing hydrant located at 732 King Street, it is calculated that 69.6L/s of fire flow will be provided. An analysis has been conducted per the Fire Underwrites Survey (FUS) to determine the minimum fire flow required by the existing hydrant to determine if the inclusion of sprinkles is needed. The analysis considers construction materials, proximity to other buildings and other factors. The calculation has determined that a minimum fire flow of 123.25L/s without sprinkles and 61.63L/s with sprinkles must be provided by the hydrant. The FUS and fire flow calculation sheets and the fire hydrant testing and inspection report can be found in appendix A.

Therefore, the existing water supply on King Street will adequately provide domestic water supply and the inclusion of sprinkles will provide adequate fire protection to the 17 unit building apartment.

SANITARY SERVICING

There is an existing 250mm diameter sanitary sewer along King Street which conveys sanitary flows northeast to an existing 350mm diameter sanitary sewer in the intersection of King Street and Paffard Street. It is proposed to connect the new apartment building to the existing 250mm sanitary sewer on King Street and extend it within the site.

The existing 250mm diameter sanitary sewer on King Street has a full flow capacity of approximately 39.24L/s. Under the existing conditions, the 250mm sanitary sewer serves a population of approximately 192 persons, producing a peak flow of approximately 4.54L/s, which utilizes 11.6% and 4.7% of the 250mm and 350mm sanitary sewers total capacity, respectively.

It is proposed to construct 17 unit apartment building with approximate equivalent population of 51 persons. With a total population of approximately 243 persons, is expected to generate a total peak sanitary flow of approximately 5.29 L/s, occupying 13.5% and 5.5% of the 250mm and 350mm sanitary sewers total capacity, respectively.

The new development will increase sanitary flows by approximately 0.75 L/s, representing an increment of approximately 2% of the total capacity of the existing 250mm diameter sanitary sewer, and approximately 1% of the 350mm diameter sanitary sewer on King Street. Therefore, it is expected that this addition will be adequate for the current capacity of the existing sanitary sewer. All the sanitary sewer calculations and supporting plans can be found in Appendix A.

STORMWATER MANAGEMENT

There are existing 450mm storm sewer on King Street, which convey stormwater flows southwest to Niagara Street, then southerly to Rye Street.

A Stormwater Drainage Area Plan was prepared in May 8, 2008 by Denco Engineering Ltd. (Denco) for the Town, as part of the King Street new storm sewer project, which delineated the storm drainage areas associated to the existing storm sewer system on King Street as shown in Appendix B.

In addition to the Stormwater Drainage Area Plan prepared by Denco Engineering, a new Stormwater Drainage Area plan was prepared by Upper Canada Consultants (UCC) as a part of the Royal Albion subdivision. As shown in the UCC plan attached in Appendix B, the storm drainage flows from the storm sewer on King Street, flow to Cottage Street and conveyed to the northwest towards Simcoe Street.

Figure 1, shows the Storm Drainage Areas from the original storm sewer design proposed by Denco where the 0.61 hectare with an associated Runoff Coefficient of 0.45 covers a portion. The original storm sewer calculations can be found in Appendix B.

The proposed and adjusted drainage areas and associated Runoff Coefficient is shown on Figure 2. The site stormwater system will collect a drainage area of 0.32 hectare at a Runoff Coefficient of 0.70. As shown in the proposed storm sewer calculation on Appendix B, the proposed conditions will produce a peak flow of 209.6 L/s, occupying 79.3% of the total capacity of the existing 450mm diameter storm sewer.

Therefore, since the majority the drainage areas A10 and A11 proposed by Denco will be conveyed to the existing Cottage Street storm sewer and the future proposed peak flows will be 11.0% less than the original peak flow proposed by Denco. It is expected that there will be adequate stormwater servicing capacity in the existing sewer network to serve the site without stormwater quantity controls.

In addition, an assessment of the major overland flows between existing and proposed conditions was conducted. Figure 3 and Figure 4, delineates the existing and proposed storm drainage areas and its associated runoff coefficients. For flow events greater than 5 year event, the storage system is full. Therefore, no expected flow will be directed to the minor system and all overland flow will be directed to Meritage Lane. As shown in Table 1, the existing overland flow to Meritage Lane during the 100 year storm event is 53.1 L/s. The expected overland flow to Meritage Lane excluding the minor flows and the 15% surcharge flow going to King Street is 30.5 L/s, which is less than existing conditions flow of 53.1 L/s.

Area #	Area (ha)	Runoff Coefficient		Peak Flows (L/s)		Overland Flow (L/s)	
		Existing	Proposed	Existing	Proposed	Existing	Proposed
5 Year Design Storm Event							
A30	0.51	0.26		33.1			
A40	0.56		0.48		67.1		
15% Surcharge (A40)					10.1		
100 Year Design Storm Event							
A30	0.51	0.26		53.1		53.1	
A40	0.56		0.48		107.7		30.5

To improve the quality of stormwater, an oil/grit separator will be utilized to provide MECP Normal Protection (70% TSS removal levels) as required for this type of development. It is estimated that a Hydroworks HD4 will provide 93% TSS removal. The complete stormwater design for this development will be identified as part of the future detailed design.

CONCLUSIONS AND RECOMMENDATIONS

Therefore, based on the above comments, drainage area plans and calculations provided for this site, the following summarizes the servicing for this site:

1. The existing 150mm diameter watermain on King Street is expected to have adequate capacity to provide both domestic water supply and fire protection to service the proposed 17 unit apartment building.

2. The receiving 250mm diameter sanitary sewers on King Street will have adequate capacity to service the Site.

3. The existing 450mm diameter stormwater sewer on King Street already has adequate capacity to serve the site.

4. Stormwater quality control will be provided to MECP Normal protection (70% TSS removal) levels prior to discharge from the site.

In conclusion, there exists adequate municipal servicing for this development. We trust the above comments and enclosed calculations are satisfactory for approval. If you have any questions or require additional information, please do not hesitate to contact our office.

Yours very truly,

Jason Schooley, P.Eng.

NOTES:

1. THE POSITION OF POLE LINES, CONDUITS, WATERMAINS, SEWER, AND OTHER UNDERGROUND AND OVERGROUND UTILITIES AND STRUCTURES IS NOT NECESSARILY SHOWN ON THE CONTRACT DRAWINGS AND, WHERE SHOWN, THE ACCURACY OF THE POSITION OF SUCH UTILITIES AND STRUCTURES IS NOT GUARANTEED. BEFORE STARTING WORK, THE CONTRACTOR SHALL INFORM HIMSELF OF THE EXACT LOCATION OF ALL SUCH UTILITIES AND STRUCTURES AND SHALL ASSUME ALL LIABILITY FOR DAMAGE TO THEM.
2. PROPERTY LINES WERE PLOTTED USING REGISTERED PLANS AND BARS LOCATED IN THE FIELD. TO VERIFY THE ACCURACY OF THESE PROPERTY LINES, A LEGAL SURVEY SHOULD BE PERFORMED PRIOR TO CONSTRUCTION.
3. ALL CONSTRUCTION MUST COMPLY WITH THE NIAGARA PENINSULA STANDARD CONTRACT DOCUMENT.

33. INLET LOAD SUMMATION ERROR (18+8+6a+17a+17b-17)/17.....	0.

CAUTION. Due to method of quality routing (Users Manual, Appendix IX)
quality routing through channel/pipes is sensitive to the time step.
Large "Inlet Load Summation Errors" may result.
These can be reduced by adjusting the time step(s).
Note: surface accumulation during dry time steps at end of simulation is
not included in totals. Buildup is only performed at beginning of
wet steps or for street cleaning.
